### Acknowledgments

A researcher completing a study based in large measure on unpublished source materials held exclusively by five Federal agencies, granted a leave-of-absence and the free use of electronic data processing equipment by a private industrial organization, receiving guidance and administrative support from the faculty and staff of a large university, certainly owes a debt of gratitude to many individuals.

Federal agency source materials relating to the national documentation center abstracting and indexing services pertinent to this study were made available by Mr. Thomas W. Laughlin, Chief Document Management Branch, Division of Technical Information Extension, U.S. Atomic Energy Commission, Mr. Carper W. Buckley, Superintendent of Documents, U.S. Government Printing Office, Mr. Bernard M. Fry, formerly Director, Clearinghouse for Federal Scientific and Technical Information, Mr. George Abdian, Deputy Director, Defense Documentation Center, and Mr. John Sherrod, Assistant Director for Systems Development, Division of Technical Information, U.S. Atomic Energy Commission. This study could not have been carried out without their help.

The study was sponsored and, in essence, made possible by the Directorate of Information Sciences, Air Force Office of Scientific Research. Particular thanks go to Mrs. Rowena Swanson, Acting Director, and Dr. Harold Wooster, Director, for their encouragement and sympathetic understanding.

I owe a debt of gratitude to Dr. Maurice F. Tauber, my adviser, as well as to other members of the Columbia University faculty, especially to Dr. Alice Bryan and Dr. Russell Shank for their comments, suggestions and detailed questionnaire critiques, and to Dr. Theodore C. Hines for his overall moral support and frequently priceless sense of humor. The understanding and patience of Mr. Donald N. Bonacci, Director of Personnel, United Nuclear

Corporation, in granting me a leave of absence to carry out this study, is highly appreciated.

A note of thanks must also be expressed here to the approximately 1,500 librarians, scientists, engineers, and administrators who were kind enough to make time in their busy schedules to comment freely and to complete rather lengthy and detailed questionnaires. The efficiency with which the questionnaires were dispatched was in no small measure due to the team effort and expertise displayed by Diane and Mark as envelope stuffers and postal-zone sorters, requiring only occasional assistance from my wife, Miriam. I am indebted to Mrs. Mildred Ballma for her help in the arduous tasks of editing questionnaires, typing notes, and proofreading initial drafts on this study.

## Introduction

During the last several decades, science and technology have undergone a drastic transformation. The enormity and depth of this transformation can be measured in many ways. It can be measured in terms of the number of students enrolled in graduate and undergraduate schools offering degrees in the physical and applied sciences, in terms of the number of new devices, products and innovations introduced into the military establishment and into the civilian sector of our economy, in terms of the number of scientists and engineers employed by industry and public and private institutions, in terms of the amounts of money expended annually on research and development, in terms of the number of technical reports, books, journals, papers, reprints, and conference proceedings stemming from these expenditures, and in many other ways.

Quantitative measurements alone are insufficient to describe fully the metamorphoses in the scope and practice of scientific and technological disciplines. The analyses of changes that have occurred in the political and physical environments within which modern science pursues its tasks, the socio-economics of support for research and development activity, and such factors as the development and use of computers and new media for scientific and technological communication would probably be just as meaningful as quantitative measures. The lone scientist experimenting in a home-made laboratory and utilizing inexpensive equipment has been replaced, in large measure, by the research team employing complex instrumentation, often beyond the means of any individual. The knowledgeable and frequently sympathetic science-oriented patron upon whose financial support the scientist depended in the past has been supplanted, for the most part, by the Federal agency supplying tax dollars collected from a multitude of remote, somewhat impersonal taxpayers. Team research has given rise to team authorship and, more frequently, to corporate authorship. The fractionalization of scientific disciplines,

the cross-linking of traditional disciplines, the creation of entirely new areas of knowledge have created concurrent demands for highly specialized information and for the more general state-of-the-art review. National security has required the compartmentalization of information. Federal agency reporting requirements, the necessity for speed in communication among a large group of researchers engaged in a motley of research projects, the proliferation and availability of "near-print" and photoreproduction equipment, have resulted in adoption of new methods of communication designed to satisfy new demands. The technical report, an outgrowth of the so-called "Third Revolution," praised by some and derided by others, has succeeded in establishing itself as one of the primary media for scientific and technological communication. A number of computer-produced or semi-automated abstracting and indexing services concern themselves primarily with the literature of technical reports and provide one of the most effective keys to the contents of that literature. These abstracting and indexing services, singled out for study in this report, have their unique place in the process of communicating research results.

## Chapter 1

### Background

In response to Congressional pressures,<sup>1, 2, 3</sup> National Science Foundation efforts, professional society suggestions, internal or external studies and recommendations,<sup>4, 5, 6, 7</sup> substantial sums have been allotted for the bibliographic control and dissemination of the scientific and technical literature stemming from government-sponsored research. As a result, the mechanized, semi-mechanized or computerized operations within the national documentation centers of the Defense Documentation Center, National Aeronautics and Space Administration, Atomic Energy Commission and Clearinghouse for Federal Scientific and Technical Information have yielded the abstracting and indexing services: Technical Abstract Bulletin (TAB), Scientific and Technical Aerospace Reports (STAR), Nuclear Science Abstracts (NSA), and U. S. Government Research & Development Reports (USGRDR).

These abstracting and indexing services have been compiled and disseminated with a view of fulfilling the functions of both information retrieval and announcement. How effectively these functions have been performed, particularly that of disseminating information about government-sponsored research, is open to question. When serving as Chairman of the Subcommittee on Reorganization and International Organizations, Vice-President Hubert Humphrey noted:

It is my judgment, the Defense Department and the Office of Technical Services have hardly tapped the surface of transmitting information to the nondefense community. . . . A sustained, well-coordinated, well-planned effort, must be made by both DOD and NASA to convert military and space scientific and technical findings into civilian technology.<sup>8</sup>

Concentration and utilization of research results primarily within defense-oriented industries have been a matter of concern to the

### Background

Department of Commerce, Department of Defense agencies, business leaders and economists. In August 1964, President Johnson signed Public Law 88-444 authorizing the establishment of a National Commission on Technology, Automation and Economic Progress which had as its aim the study of the probable pace of technological change, the problems such change will bring and the means of speeding and increasing the benefits of advancing technology. On September 14, 1965, the President signed the State Technical Services Act designed to facilitate diffusion of information to private industry through state and local organizations. On signing the law, the President noted: "We are committing ourselves to an intelligent and an orderly application of the great technical and scientific breakthroughs of our time."<sup>9</sup>

One of the basic assumptions underlying this study is that the utilization of technical information can be accelerated and intensified through the purposeful exploitation of national documentation center abstracting and indexing services; such services need to be considered more than reference tools confined primarily to the library reference room and utilized, for the most part, by the librarian for information retrieval purposes. These services need to be made accessible to more than a fraction of potential research-oriented organizations. If imaginatively distributed and used, the services can, in effect, act as social instruments capable of promoting national technological, economic and social goals.<sup>10</sup>

### The Problem

What, then, is the present distribution pattern for the abstracting and indexing services of NSA, STAR, TAB, and USGRDR which were designed to meet the interlocking, mission-oriented interests of the Department of Defense, National Aeronautics and Space Administration, Atomic Energy Commission, and the Department of Commerce? How effective is this distribution pattern in terms of support of national technological, economic and social goals? Which research-oriented organizations currently receive these services? What are the characteristics of the recipients of these services? For what purposes and with what frequency are the services being

#### Background

used? Is there a discernible geographic, institutional, industrial or subject discipline distribution pattern that is characteristic for these services? Is there a relationship, for example, between the geographic distribution of these abstracting and indexing services and the geographic distribution of research and development funds? Can we identify the research-oriented organizations and institutions that currently receive none of the services? If so, what are some of the characteristics of the nonrecipient population? Can we determine whether the nonrecipient population is aware of the availability of the services? Can we pinpoint national documentation center policies which would tend to enhance or impede the dissemination of these services to the segments of the scientific and technological community which are capable of fostering innovation or of applying R & D results?

#### Related Research

A number of studies relate tangentially to the problem outlined above. Some of the studies bear on the scientific and technological information needs and uses of specific clienteles.<sup>11, 12, 13, 14</sup> Studies frequently reflect the interest of the mission-oriented sponsor.<sup>15, 16, 17</sup> In some instances, abstracting and indexing services covering related subjects have been investigated.<sup>18, 19, 20, 21</sup> More general investigations have been undertaken to determine the purposes for which scientific information is used and the steps that the scientist takes to acquire this information;<sup>22</sup> the information flow pattern among scientists<sup>23</sup> or within an industrial organization;<sup>24</sup> the overall problem of disseminating technical report literature;<sup>25</sup> the speed with which technical report literature is announced;<sup>26</sup> factors influencing the publication and announcement of technical reports;<sup>27</sup> and the use made of technical reports within a specific subject discipline.<sup>28</sup> A study was under way on the use made of Nuclear Science Abstracts by members of a particular professional society,<sup>29</sup> and Phase II of the DOD User Survey relates to Department of Defense contractor acquisition and use of scientific and technical information.<sup>30</sup> A broad investigation to determine the "current status and effectiveness" of some 500 U.S. abstracting and indexing

## Background

services has been conducted by the System Development Corporation. 31

None of the studies cited above deal with the diffusion of STAR, TAB, NSA, and USCDR. While some of the researchers seek to analyze the use made of specific abstracting and indexing services, none of them applies comparable methodology to the four abstracting and indexing services considered in this study. No investigations were found analyzing the use of these abstracting and indexing services within a broad range of industries, subject disciplines, educational, governmental or private subscriber recipients. Neither have studies been located aiming to identify and describe the nonrecipient research-oriented industrial or institutional population.

## Hypotheses

The hypotheses to be tested are the following:

1. National documentation center abstracting and indexing services are at present inadequately utilized as vehicles for the diffusion of results from government-sponsored research.
2. An economically undesirable pattern exists in the distribution of these abstracting and indexing services in that:
  - (a) Industries and institutions having government contracts are the primary recipients of national documentation center abstracting and indexing services.
  - (b) Industries and institutions having no government contracts generally do not receive, and frequently are unfamiliar with these abstracting and indexing services.
3. There is a marked correlation between the extent of receipt and utilization of national documentation center abstracting and indexing services within certain geographic regions and industries, and the degree of innovation and economic expansion within these regions and industries.

## Limitations

Abstracting and indexing services constitute only one of the media for dissemination of scientific and technological information. Other investigators have concerned themselves with general analyses

## Background

of the broader range of media including planned or unplanned communication that takes place outside abstracting and indexing services, outside the library or information center, indeed, outside the literature.<sup>32</sup> This study is limited to analysis of services concerned primarily with abstracting and indexing the technical report literature published as a result of government-sponsored research. It is assumed that a service providing access to abstracts through detailed indexes and allowing a more generalized approach through use of the table of contents is preferable to one providing either indexes without abstracts or abstracts without indexes. Title, brief subject, or keyword-oriented services such as Monthly Catalog of United States Government Publications, and Keywords Index to U.S. Government Technical Reports, since they do not provide abstracts, are considered outside the scope of this investigation. Similarly, services such as Fast Announcement Service (Clearinghouse for Federal Scientific and Technical Information), while highly relevant to the general theme of this investigation, are omitted because of their lack of indexes. Limitation of coverage to the technical report literature excludes such services as International Aerospace Abstracts, or Index Medicus, since, for the most part, they cover the open or journal literature. The investigation deals primarily with the analysis of the overall diffusion pattern and the use made by non-Federal, non-military U.S. recipients of Nuclear Science Abstracts (NSA), Scientific and Technical Aerospace Reports (STAR), Technical Abstract Bulletin (TAB), and U.S. Government Research & Development Reports (USGRDR).

The above services are the principal media for disseminating results of research programs sponsored by their respective agencies, and these agencies spend more than 90 percent of the \$15 billion currently allocated in Federal research and development funds.

## Methodology

The literature bearing upon the economic and social influence of scientific and technological information was examined. National systems for organizing and diffusing technological information, particularly those of Soviet bloc countries, were studied and the

#### Background

dissemination functions of the abstracting and indexing services of the various national documentation centers were investigated.

Mailing lists for the abstracting and indexing services of NSA, STAR, TAB, and USGRDR, included those for GPO depository libraries, AEC depository libraries, private subscribers, AEC, DOD, or NASA contractors and official recipients, Smithsonian Institution exchanges, and Library of Congress exchange agreements. These mailing lists were arranged in a single alphabetical file and non-Federal U. S. recipients were assigned codes to denote educational institutions, industrial corporations, state or local government bodies, service received, number of copies, geographic locations, and the prime subject specialty of the individual recipient and his employer.

All coded data were keypunched on standard EAM equipment and were transferred to magnetic tape. A Control Data 1604-A computer was programmed for grouping and permuting the various coded characteristics of the non-Federal U. S. recipients.

A stratified random sample of industrial, institutional and private subscribers was obtained for NSA, STAR, TAB, and USGRDR. Since a great deal was known about the recipients, a statistically significant sample was derived which took into account such factors as geographic distribution, service received, and type of user.

A questionnaire was devised to elicit facts regarding user and institutional background and to determine how the abstracting and indexing services were used once they reached the receiving organization. Information was sought to answer such questions as: What is the recipient's primary activity? What is his subject specialty? What is his publishing or innovation record? To what extent is the recipient's company or institution research-oriented? To what extent does the recipient or his colleagues make use of the abstracting and indexing service mailed to his attention?

The data resulting from the questionnaire were keypunched and converted to magnetic tape. The questions were grouped, tabulated, compared and contrasted with other tabulated relevant questionnaire responses.

The directories, Industrial Research Laboratories of the United

#### Background

States (Bowker Associates, 1965) containing 3,260 industry listings, Roster of U. S. Government Research and Development Contracts in Aerospace and Defense (Bowker Associates, 1965) containing 1,096 industry and institutional listings, and List of Small Business Concerns Interested in Performing Research and Development (U. S. Small Business Administration, 1963) containing 2,775 companies were searched against the Non-Federal U. S. Recipient File. A statistically significant source file was established for the nonrecipient population representing primarily industrial organizations supposedly receiving none of the services under investigation. A ten percent sample was selected from the nonrecipient file.

A questionnaire for the nonrecipient population was designed to establish the magnitude of R & D activity, company subject interests, the use made of various other abstracting and indexing services and types of approaches utilized in acquiring and using scientific and technological information. A number of questions identical with those in the Recipient Questionnaire were retained in the Non-recipient Questionnaire. This was done to facilitate comparison between the information gathering patterns among recipients and non-recipients of the Federal abstracting and indexing services.

The responses to the Nonrecipient Questionnaires were key-punched and transferred to magnetic tape. The responses were compared with those derived from the Recipient Questionnaires.

The various phases of the study have been treated in subsequent chapters as follows:

Chapter II is devoted to national trends in research and development and the economic effects resulting from maximum exploitation of R & D findings. The growth of U. S. Federal research and development support is examined vis-à-vis non-Federal support for research and development. The relationship between research and development expenditures and the need for systematic diffusion of information stemming from these expenditures is discussed.

Chapter III examines the use of abstracting and indexing services for the communication of research results. Since the abstract has been purposefully and extensively used in Soviet bloc countries

## Background

as the official communication medium in this field, the information service environment and use made of abstracts in Poland, Czechoslovakia, Hungary, East Germany, and the Soviet Union was investigated.

Chapter IV presents the U.S. diffusion pattern for the abstracting and indexing services of Nuclear Science Abstracts, Scientific and Technical Aerospace Reports, Technical Abstract Bulletin, and U.S. Government Research & Development Reports. Detailed statistical analyses are provided for non-Federal U.S. recipients, who are grouped by subject specialty, type of industry, geographic location, and a number of other variables. More general statistical information is made available for Federal agency recipients, GPO Depository Library recipients, as well as recipients outside the United States and its possessions.

Chapter V describes the sampling method and reports the results of analysis of the Recipient Questionnaire that was sent to a representative group of non-Federal U.S. recipients. Data on individual recipient characteristics as well as information on recipient organization environment were quantified and analyzed. The categories of information sought and data on the actual use made of the abstracting and indexing services are displayed in tabular form. Generalizations are derived on the basis of the quantified data.

Chapter VI is devoted to the identification and analysis of the nonrecipient population. Search results are presented derived from the comparison of the address files of known recipients of the abstracting and indexing services and listings of research-oriented industrial nonrecipient firms and institutions found in a number of specialized directories. Responses to the Nonrecipient Questionnaire are tabulated and analyzed and the data compared with those derived from the Recipient Questionnaire.

Chapter VII summarizes the salient findings relating to the hypotheses tested. Current national policies and practices bearing on the dissemination of federally-sponsored research results are reviewed in light of this and other investigations. Recommendations are made with respect to a national information dissemination policy.

## Chapter 2

### Information as an Economic Resource

A strong U. S. economy is now deemed capable of wielding far greater influence than military force. It needs to be sustained and enriched as a matter of sound strategic policy.<sup>1</sup>

What are the factors that tend to increase productivity? Is an increased rate of economic growth to be attained primarily by substantial investment in capital plant and equipment? What effect do such economy input variables as training and education or research and development have on national economies or individual corporate enterprises?

The effect of human capital on productivity has been largely neglected in the past. Virtually all economic studies have emphasized the role of nonhuman capital. This resulted in the widely held belief that an increase in nonhuman capital per worker would result in a corresponding increase in productivity per worker, which is quite misleading. When applied to economic planning for underdeveloped nations, the simple capital-output ratios proved to be erroneous.<sup>2</sup>

Economic growth is increasingly being considered as the cumulative result of capital investment in machines and labor and of national resources devoted to developing and improving the economy input variables usually grouped under the term technical progress. Recent studies taking into consideration both physical and non-physical capital investments indicate that in mature industrial countries the rise in physical capital accounts for only a fraction of the long-term increase in labor productivity.<sup>3, 4</sup> Rather, it is investment in the nonphysical technical progress that accounts for up to 90 percent of the increase in real product per person employed.<sup>5</sup> Specifically, investments in education or in research and development have been shown to lead to improvements in the quality of capital and labor

Information as an Economic Resource and thus have resulted in increased productivity. The effect of R & D on productivity can usually, though not immediately, be noted in efficiency of equipment, efficiency of processes and methods, efficiency of products. An increase of \$40 to \$80 billion of the \$365 billion Gross National Product of 1953 was attributable to R & D conducted during the period 1928-53.<sup>6</sup> Fast growing industries, such as the electronics, chemical and aerospace industries, have generally showed a relatively high ratio of R & D expenditure to output, while slow growing industries, such as the textiles, food and lumber industries, usually had a low ratio. This trend has been analyzed by Hoffman<sup>7</sup> and Maizels<sup>8</sup> and is apparent through examination of Tables 1A and 2A, Appendix A.

Investigations of British research-based industries reveal that their output has been growing twice as fast as that of manufacturing industries in general. While British exports have increased by 3.1 percent per year during the past eight years, the annual growth rate of exports for the chemicals industry has been 10.4 percent and for the electronics industry 7.9 percent.<sup>9</sup> A study of five U.S. firms in the drug and pharmaceutical industry and eighteen firms in the chemical and allied products industry established empirically the relationship between R & D expenditures and productivity increase. A number of other input variables were also tested. The basic conclusion of the study is that "beyond a reasonable doubt, causality runs from research and development to productivity, and finally to profitability." It is further noted that

no other input factor tested (except possibly differential monopoly power whose influence was not fully established) was able to compete effectively with, or even to complement substantially, the relationship found between the above variables.<sup>10</sup>

A detailed study of the chemical, petroleum and steel industries, sponsored by the National Science Foundation, the Ford Foundation and the Cowles Foundation, suggests that the number of significant inventions developed by a firm is highly correlated with the size of its R & D investment.

Although the payout from an individual R & D project

### Information as an Economic Resource

is obviously very uncertain, it seems that there is a close relationship over the long run between the amount a firm spends on R & D and the total number of important inventions it produces.

Other studies have established a correlation between the percentage of gross sales spent on R & D and the return on the stockholders investment (see Table 3A, Appendix A). An investigation of ten chemical companies, covering a 13 year period, revealed that "for each dollar spent on research, a total of 30 dollars of additional sales was generated in the fourth through the 10th year after the end of the research period."<sup>12</sup> Ewell's study indicates that one dollar of research expenditure resulted in at least 25 dollars of added Gross National Product over the following 25 years.<sup>13</sup>

### Expenditures for Research and Development

Whether based on demonstrable facts or intuitive knowledge, many industrialized as well as underdeveloped nations have substantially increased their expenditures for research and development. As used in this report, the generic term "research and development" (R & D) encompasses the whole spectrum of activity covered by the terms "basic research," "applied research" and "development." Following definitions used by the National Science Foundation,<sup>14, 15</sup> the specific terms signify the following:

**Basic Research** - Research projects which represent original investigation for the advancement of scientific knowledge and do not have specific commercial objectives, although they may be in fields of present or potential interest to the reporting company.

**Applied Research** - Research projects which represent investigation directed to discovery of new scientific knowledge and which have specific commercial objectives with respect to either products or processes.

**Development** - Systematic use of scientific knowledge directed toward the production of useful materials, devices, systems or methods, including design and development of prototypes and processes.

While positive efforts have been exerted within recent years to collect statistics on research and development expenditures, many nations as well as individual institutions find this to be a difficult

Information as an Economic Resource task. The input data comprising research and development are prone to subjective interpretation and the resultant statistics, even when officially collected, often pose serious problems from the point of

1963, p. 25

Information as an Economic Resource  
view of definition and comparability. In spite of these shortcomings, R & D statistics, since they are major constituents of technical progress, provide one of the best indicators available for appraising other than physical capital investments made nationally or by individual industrial enterprises.

Estimates of research and development expenditures for a number of countries have been collected and analyzed by the staff of the Organization for Economic Cooperation and Development. As indicated in Figure 1, the R & D expenditures have been measured against the Gross National Product (GNP) of the respective countries. Ratios between expenditures for research and development and the Gross National Product (the market value of the output and services produced by a nation's economy) indicate the R & D investment trends within the framework of the total national income.

Comparative analyses of countries at varying stages of industrial development indicate, as shown in Figure 2, that the research ratio tends to rise with the growth of the per capita Gross National Product. The inference can thus be made that nations having a high per capita GNP have a substantially higher research ratio than nations having a low per capita GNP. Figure 2 indicates that advanced industrial nations spend more than one percent of their GNP on research and development while underdeveloped countries spend less than 0.25 percent. The share of GNP allocated to research and development in the Soviet Union has been estimated at 2.87 percent for the year 1960.<sup>16</sup>

#### U. S. Federal Support of Research and Development

The Federal Government has been supporting research since the 19th Century. The Hatch Act of 1887 provided for the establishment of an agricultural experiment station at each state land grant college or university and provided for an annual appropriation for the partial funding of these state experiment stations. This was one of the earliest landmarks of Federal support for research and development programs,<sup>17</sup> but major funding for research and development was not provided by Congress until just before World War II. The end of World War II, with its awesome demonstration of the

### Information as an Economic Resource

application of science and technology for military purposes, brought the realization that the United States could not entrust its security to the scientific progress of a war-shattered Europe. This resulted in Congressional authorization for a number of Executive agencies to undertake research and development in support of their respective missions.

Since the end of World War II, Federal R & D expenditures have risen continuously. Table 1 shows that Federal expenditures for research and development rose from 74 million in the forties to an estimated total of \$15.5 billion in 1966.

Table 1

### Expenditures for Federal Research and Development, and Research and Development Facilities, 1940-1966

(Millions of Dollars)

Fiscal Year	Total Budget Expenditures	Total R & D and R & D Facilities Expenditures	Percent of Total Federal Expenditures
1940	9,055	74	0.8
1941	13,255	198	1.5
1942	34,037	280	.8
1943	79,368	602	.8
1944	94,986	1,377	1.4
1945	98,303	1,591	1.6
1946	60,326	918	1.5
1947	38,923	900	2.3
1948	32,955	855	2.6
1949	39,474	1,082	2.7
1950	39,544	1,083	2.7
1951	43,970	1,301	3.0
1952	65,303	1,818	2.8
1953	74,120	3,101	4.2
1954	67,537	3,148	4.7
1955	64,389	3,308	5.1
1956	66,224	3,446	5.2
1957	68,966	4,462	6.5
1958	71,369	4,990	7.0
1959	80,342	5,803	7.2
1960	76,539	7,738	10.1
1961	81,515	9,278	11.4
1962	87,787	10,373	11.8
1963	92,642	11,988	12.9
1964	97,684	14,694	15.0
1965 (estimate)	97,481	15,371	15.8
1966 (estimate)	99,687	15,438	15.5

### Information as an Economic Resource

Source: U.S. National Science Foundation, Federal Funds for Research, Development, and Other Scientific Activities, 1966. (NSF 65-19). Washington, D. C., U.S. Govt. Print. Off., 1966, p. 2.

In 1920 Federal and non-Federal R & D expenditures were 0.09 percent of our Gross National Product; in 1930, 0.14 percent; in 1940, 0.37 percent; in 1950, 1.01 percent and in 1960, 2.78 percent.<sup>18</sup> These figures are essentially in agreement with those provided by the National Science Foundation (Figure 3) for the period 1958-1963.

Figure 3

Research and Development as Percent of the Gross National Product, 1958-63

Source: "Research and Development and the Gross National Product." Reviews of Data on Science Resources. v. 1, no. 4, May 1965, p. 9. (NSF 65-11).

#### Information as an Economic Resource

The proportion of the United States' GNP devoted to R & D increased almost 750 percent during the last two decades and almost 2000 percent over the last three decades. Throughout this period

Figure 4

Trends in Federal Expenditures for Research  
Development, and R & D Plant, by Agency

Source: U.S. National Science Foundation. Federal Funds for Research, Development and other Scientific Activities: 1968. (NSF-65-19). Washington, D. C., U. S. Govt. Print. Off., 1966, p. 4.

Information as an Economic Resource  
approximately 80 percent of Federal R & D funds were expended by just three agencies: the Department of Defense, National Aeronautics and Space Administration (formerly National Advisory Committee for Aeronautics) and the Atomic Energy Commission. Federal agency R & D expenditures for the period 1940-1966 are presented in Figure 4. (See also Table 4A, Appendix A).

#### Public vs. Private Support for R & D

While industrial organizations, educational institutions and Federal government agencies have all progressively increased their research and development expenditures (see Table 5A, Appendix A), and although many industrial organizations have indicated further increases in their R & D obligations (see Table 6A, Appendix A), a decided shift has become apparent in the relative amounts of R & D support provided by the Federal government vs. private industrial organizations. To an ever increasing degree, the Federal government has assumed responsibility for funding research and development. The trends of Federal support as compared with industrial and educational or nonprofit institution support for R & D is portrayed in Figure 5. This indicates that since about 1943 the Federal government has been supplying more than half of the money spent on research and development in the United States.

Testifying before the House of Representatives Select Committee on Government Research, Jerome B. Wiesner, Director, Office of Science and Technology, stated:

As a source of funding for research and development, the Federal government has constantly since World War II been obliged to expand its role as sponsor of scientific and technological activities.... The high percentage attributable to the Federal share... reflects pressing and costly demands of national security, economic welfare and health for the contributions of science and technology, in areas where private institutions cannot recapture sufficient or prompt returns as incentives to investment. <sup>19</sup>

The Federal government will provide sixty-six percent of the approximately \$23 billion of R & D funds to be expended by both public and private institutions during fiscal year 1966/67. <sup>20</sup>

#### Need for Information Diffusion

### Information as an Economic Resource

What are the implications of these Federal R & D expenditures for the information science profession or, for that matter, for the nation as a whole?

Investment in research and development will not, by itself, contribute to increased productivity. Were economic growth purely a function of R & D investment, the rate of growth of the GNP would bear a strong relationship to the magnitude of R & D investment. As may be seen from Figure 6, this has not been the case. The enormous increases in R & D investments have not been followed by parallel and corresponding increases in the U. S. rate of economic growth. The implication is that application of scientific and technological

Figure 5

### Sources for Research and Development Funds

Source: U. S. Congress. Senate. Select Committee on Small Business. The Role and Effect of Technology in the Nation's Economy. Hearings before a Select Sub-committee, 88th Cong., 1st Sess., May 20, 1963. pt. 1. Washington, D. C., U. S. Govt. Print. Off., 1963, p. 33.

Information as an Economic Resource  
 information resulting from research and development activity is crucial to economic growth.<sup>21, 22</sup> Reduction of the time lag between the development of innovations and their wide-spread introduction into industry is also of signal importance.

Discussing the question of science, economic growth, and innovation, Dr. Alexander King, Director of Scientific Affairs, Organization for Economic Cooperation and Development notes:

...innovation is the process through which science fosters this [economic] growth and the problem of innovation is the key to the industrial future. Innovation is not a simple matter of technical communication, even when that communication is good, which today it is not. Complex social and economic factors are involved. Innovation depends on government policy, fiscal and other matters and it has a great deal

Figure 6

Comparison of Growth of R&D Funds With  
 Growth of GNP and Federal Budget

Source: Rubel, John H. "Trends and Challenge in Research and Development." In National Security Industrial Association. The Impact of Government Research and Development Expenditures on Industrial Growth. Proceedings of R & D Symposium, 13-14 March 1983. Washington, D. C., 1983, p. 13.

### Information as an Economic Resource

to do with the policy or lack of policy of firms and industries; it is influenced by problems of depreciation, with the psychology of managers, with their sense of inferiority when faced with complex modern technology, with acceptance of new methods by the workers and their unions and with all the complex difficulties and social consequences of change. Technical information is an element of the whole innovation process, although it may be the most important single factor.<sup>23</sup> [emphasis supplied]

The immediate product of Federally-supported research and development is frequently not hardware, but information--information which is communicated primarily through the technical report. While other communication media may be utilized to disseminate research data, it may be assumed that inefficient utilization of technical report literature tends to reduce the effectiveness of the knowledge derived from the research and development. This was one of the conclusions reached by a number of congressional committees investigating Federal agency practices in organizing and disseminating the results of government-sponsored research.

More than a hundred years ago, in passing the Organic Act establishing the Department of Agriculture, the Congress showed its awareness of the need to utilize available information. This Act specified that the newly created Department was "to acquire and to diffuse among the people of the United States useful information on subjects connected with agriculture in the most general and comprehensive sense of that word..."<sup>24</sup> Not only was agriculture the exception to the overall inadequate diffusion pattern for scientific and technological information, even its agricultural extension service which has been most successful in practically all its programs, required 14 years to achieve adoption of hybrid corn by Iowa farmers.<sup>25</sup>

Agricultural problems in a particular region could often be solved through the diffusion of techniques or processes having wide and generalized application. The introduction of commercial fertilizers or the planting of hybrid corn did not demand the tailor-made intensive information service essential for such things as the problem of the machine-tool manufacturer who encounters difficulties in joining two dissimilar alloys. Another factor is that there are approxi-

Information as an Economic Resource  
nately 312,000 manufacturing companies in the United States and  
that they have a wide variety of information needs.<sup>26</sup>

An indication of the time lag in industrial applications is the fact that forty years elapsed between the first successful use of the tunnel oven and its general acceptance in the pottery industry.<sup>27</sup> A study of twelve important innovations in the bituminous coal industry, iron and steel industry, brewing industry, and railroad industry indicates that, measured from the date of the first commercial application, it took twenty years or more for all the major firms to adopt a number of vital innovations. In three only instances was the time period ten years or less.<sup>28</sup> Obviously, inefficient dissemination of information has been very costly to the national economy.

Expansion of information services to the industrial community at large has been limited by opposition from major segments of industry as well as from industrial associations, including the National Association of Manufacturers and the U. S. Chamber of Commerce. The argument against an industrial information service similar in intent and function to that of the agricultural extension service was based on the fear that the provision of such a service would tend to upset the competitive balance. Established firms saw the threat of competition from weaker competitors who might adopt innovations and processes to invade their markets.<sup>29</sup>

Studies carried out by Arthur D. Little Inc. for the National Science Foundation and the Department of Commerce indicate that there is some basis for these fears.<sup>30</sup> Industries, such as textile, building, and machine tools and the newer industries such as chemicals and electronics were analyzed to determine the source, over the last fifty years, of their technically and economically significant innovations as well as the factors leading to the development and adoption of these innovations. The conclusion reached is that industries of high sophistication have led in both investment for research and in application of research results. Furthermore, the major innovations adopted by research-oriented industry, such as plastics, transistors and turbojets, have been developed and, whenever feasible, economically marketed from within the innovating industry.

### Information as an Economic Resource

During the thirty year period covered by the study, the traditional industries, while improving products and processes and attaining substantial increases in productivity, developed little new technology of major economic significance. The few major technical and economically important innovations adopted by traditional industry came primarily from outside the industry, from foreign technology, from independent inventors or from new small firms.<sup>31</sup> In considering the "innovation by invasion" process, the investigators noted that in principle, "an industry about to be invaded could simultaneously be an invader itself." This has not been the case. Companies in textiles, building, or machine tools have not invaded other industrial areas with new ideas; instead the new, fast-growing, technically advanced industries have invaded stable or declining industries. For textiles, building, and machine tools, the invaders have been the chemical industry and the aerospace industry. The building industry has been invaded by all industries having advanced manufacturing techniques.<sup>32</sup>

It is understandable that organized Federal diffusion of new technology would tend to generate resistance, yet from the point of view of national economic well-being, not only the creation, but the most widespread utilization of the latest technology is highly desirable.

### Summary

The rate of economic growth has been of considerable concern to industrialized as well as to underdeveloped nations. Recent studies dealing with economic effects of investment in human capital (i.e., training, education, basic research, applied research and development, which is generally grouped under the term technical progress) when compared with investment in machinery and labor, made it abundantly clear that technical progress was responsible for the major part of increases in national productivity and in rates of economic growth.

Research and development investment, a major component of technical progress, has been found to be a causative factor in increased productivity and profitability within certain industries. More-

Information as an Economic Resource  
over nations as well as the segments of industry which invested heavily in research and development were found to be in the forefront of economic expansion.

While allocation for research and development have increased tremendously within the last few decades, it is now being recognized that not merely investment in R & D, but utilization of the results of R. & D is of crucial importance to national economies or private enterprises. Effective information transfer is one of the prime components leading toward widespread adoption and utilization of research findings. Industry attitudes tend to inhibit maximum information diffusion. However, national welfare requires full exploitation of all information derived from the expenditure of public funds.

### Chapter 3

#### Abstracting and Indexing Services as Diffusion Media

In considering diffusion of scientific and technical information one must take full cognizance of the role played by abstracting and indexing services in the diffusion process.

The first science abstracting journal, Le Journal des Scavans, had its 300th anniversary in 1965.<sup>1</sup> Various forms of abstracting and indexing services have been issued and they have grown rapidly in number. For the year 1959, the Soviet national documentation center, VINITI, reported 1,494 such services, including 360 devoted entirely to abstracting and indexing.<sup>2</sup> The figures were partially detailed as follows:

<u>Country</u>	<u>Total Services</u>	<u>Purely Abstracting and Indexing Services</u>
United States	300	60
USSR	260	20
Japan	200	10
Great Britain	191	40
France	162	22
West Germany	134	36

A more recent U.S. compilation lists 1,855 such titles, issued in 40 countries, of which 365 are reported to be published in the United States. Bourne<sup>4</sup> arrived at a comprehensive estimate of 3,500 abstracting and indexing services, including 450 published in the United States. Figure 7 indicates that abstracting journals have kept pace with the overall rise in the publication of scientific and technical journal literature. The increase in the total number of abstracts published in Chemical Abstracts<sup>5</sup> and in some other representative services during 1955 and 1965 (Table 2), is a further indication of the effort to cope with the world-wide increase in scientific and technological publishing.

Figure 7  
Number of Scientific Journals and Abstract Journals

Source: Price, Derek J. "The Exponential Curve of Science." Discovery, v. 17, no. 6, June 1956. p. 242.

In recent years there has been a proliferation of KWIC-type services and of title announcement media for reference use and for current awareness service. Indications are, however, that information retrieved on the basis of titles only is not as relevant as that obtained with the aid of abstracts.<sup>6</sup> There is also evidence to indicate that selection of publications through perusal of titles is far less accurate than selection by reading abstracts.<sup>7</sup>

There have been a number of studies on the usefulness and effectiveness of abstracting and indexing services.<sup>8, 9, 10, 11</sup>

While there has been sporadic and intense criticism of

# Soviet Diffusion Pattern

(a) Estimate

abstracting and indexing services,<sup>12</sup> for the most part the criticism has centered on inadequate abstracting, lack of indexing, undue delay in publishing, lack of comprehensiveness, lack of selectivity, etc., rather than on any inherent inadequacy of the abstracting and indexing service as a mechanism for the diffusion of research results. The mass of scientific and technical information now being published in a variety of languages, the inordinate cost of making a systematic review of a literature that is not organized, the limited

#### Soviet Diffusion Pattern

access to source materials and the limited time available to perform a search have all contributed to making the abstracting and indexing service one of the prime clearinghouses for current additions to knowledge. Abstracts provide the capability to concentrate within a single publication knowledge that is recorded in a multitude of research papers and technical reports. Adequate and efficient indexing can achieve a synthesis of the fractionalized, dispersed portions of new knowledge. Information thus assembled and indexed can be of significance to the researcher in providing the background needed for further synthesis of information. Such a synthesis represents a link in the communications chain between the scientist and engineer and provides another argument in favor of abstracting and indexing services. In reviewing and summarizing extensive hearings on U. S. scientific information dissemination, a Congressional Committee staff report noted:<sup>13</sup>

It is believed by many that the most effective and economical way of bringing world scientific information to the attention of American scientists and stirring their interest in it is an effective system of distribution of abstracts. Carefully prepared abstracts are economical to distribute widely and permit the individual scientist to keep himself abreast of worldwide scientific developments in his field with little expenditure of time. Carefully prepared abstracts encourage scientists to seek copies of articles of interest, either through lending libraries, purchase, or photographic reproduction.

Primary distribution of AEC, NASA, and DOD technical reports is often made directly by contractor organizations as well as by the national documentation centers of these agencies. This is a costly process and it is limited to a relatively small group of recipients. In almost all instances, prior approval is necessary in order to be placed on such distribution lists, yet the history of science and technology is replete with examples illustrating the impossibility of predicting with any certainty the application that can be made of data or information resulting from any scientific investigation.<sup>14</sup> Moreover, for economic reasons this limited primary dissemination of full size copies of technical reports has recently been reduced drastically in favor of the microfiche form. For this reason

### Soviet Diffusion Pattern

the abstract has to be relied upon as one of the few media currently available for general communication of information about R & D activity of these agencies.

### Soviet Bloc Exploitation of Abstracting and Indexing Services

Nowhere has the abstract been more fully adapted and more doggedly exploited in the diffusion of scientific and technical information than in communist countries. Whether indicative or informative,<sup>15</sup> in card format or published in primary journals or in abstracting and indexing services, the abstract has been frequently used as the official medium for current awareness and information retrieval.

While methods employed in disseminating information within particular countries depend in large measure upon their internal socio-political systems, problems and solutions relating to information diffusion for the more industrialized nations of the world, whether communist or not, generally have been found to have a common base. This is true particularly when the publication media are under the control of government agencies and when the information to be disseminated, which is derived through the employment of public funds, is not subject to copyright.

### Poland

Some 84 centers in Poland receive and abstract literature in specifically designated subject disciplines. The abstracts, in manuscript form, are forwarded to the Central Institute for Scientific, Technical, and Economic Information (Centralny Instytut Informacji Naukowo-Technicznej i Ekonomicznej, CIINTE)<sup>16</sup> where they are edited, printed on cards (Figure 8) and sold or distributed to "manufacturing plants, laboratories, planning and administrative offices of various industries, institutes, universities and other institutions of higher learning, engineering and improvement clubs, and individuals." The subscriber may select one or more of 850 subject fields assigned and arranged in accordance with the Universal Decimal Classification system. Some of the cards provide on the verso the full text in microprint. Since its founding through 1962, CIINTE has printed and disseminated a total of 55 million cards, averaging approximately 4-1/2 million cards annually.<sup>17</sup> Some 700,000 titles

were abstracted in 1950-1959. An equivalent number of photocopies (including 420,000 supplied by CIINTE) and 7,500,000 microfilms (5,700,000 supplied by CIINTE) were supplied to subscribers during that period.<sup>18</sup> In 1959, the Institute is reported to have sold approximately 7-1/2 million cards. Of these, 55 percent went to industrial recipients, 23 percent to technical schools and colleges, 20 percent to governmental bodies, and 5 percent to miscellaneous subscribers.<sup>19</sup> In 1965 the Institute distributed about 10 million cards, covering approximately 100,000 titles.<sup>20</sup>

About 15 percent of the titles distributed in the form of abstract cards are also published in a number of primary scientific and technical journals, industry information bulletins and abstracting

#### Soviet Diffusion Pattern

and indexing services. The quarterly CIINTE abstracting journal, Obzor Polakof Tekhnicheskof Literatury - Polish Technical Abstracts, published in English and Russian, contains on the average 167 pages of abstracts of selected scientific and technical papers written by Polish scientists and engineers. Such publications as Przegląd Dokumentacyjny Elektrotechniki (Documentation Review for Electrotechnology) issued by the Institute for Electrotechnology, Biuletyn Dokumentacji Naukowo-Technicznej (Science-Technology Documentation Bulletin) issued by the Institute for Automotive Transportation, Biuletyn Dokumentacyjny Metali Nieżelaznych (Documentation Bulletin for Non-ferrous Metals) issued by the Science-Technology Documentation Section of the Institute for Nonferrous Metals, Przegląd Dokumentacyjny Hydrologii i Meteorologii (Documentation Review for Hydrology and Meteorology) issued by the State Hydro-Meteorological Institute, unlike abstracts in card form, illustrate the decentralized publication and dissemination of abstract-type journals within the Polish documentation network. A total of 110 documentation reviews, 94 express-information type publications and 304 information bulletins were issued during 1964.<sup>21</sup>

#### Czechoslovakia

The abstract has been a basic medium for technical and scientific communication in Czechoslovakia. For the period 1957-1959, centralized abstracting evaluated about 2,500 journal titles annually in addition to other documents.<sup>22</sup> The abstracted information was disseminated both in card form and in abstract journals. The "Kartoteka technické a ekonomické literatury," (Card-File of Technical and Economic Literature) was distributed weekly in DIN A6 (Deutsche Industrie-Norm, 148x160 mm) format. It went to more than 1,000 subscribers. Approximately 100,000 abstracts (10 million cards) were sold during 1959.<sup>23</sup> With the transfer in 1959 of the Bibliographic Department of the State Technical Library (Formerly the Library of the Technical University of Prague), the Center for Scientific, Technical and Economic Information (Ústřední vědeckých, technických a ekonomických informací)<sup>24</sup> has, among other responsibilities, been assigned the function of evaluating, indexing and abstracting the

#### Soviet Diffusion Pattern

scientific and technical literature through the support and coordination of the decentralized information centers.<sup>25</sup> The industrial centers share in collecting and processing of information and making it available to the Center as well as to their own industries, scientists, and engineers. In 1959 about 165 such centers prepared a total of 28,000 abstracts, selected from 32,000 serial issues.<sup>26</sup> Abstracts, both those prepared by the Center's own staff and those received from industrial information centers, are disseminated by the Center in card form and in journals.<sup>27</sup> The comprehensive centrally issued abstract journal, Prehled technicke a hospodarske literatury (Survey of Technical and Economic Literature) represents the result of interaction between the Center and local industrial documentation units. During the year 1959 the Center had approximately 4,550 subscribers for various sections of Prehled (see Table 7A, Appendix A). Only about half of the abstracts received by the Center were published in the Prehled. Librarians as well as scientists and engineers are urged to make full use of internally produced as well as foreign abstracting and indexing services.<sup>28</sup>

#### Hungary

Until 1962 Hungarian information services were carried out mostly by technical libraries attached to scientific institutes and industrial enterprises. The National Committee for Technological Development (Országos Műszaki Fejlesztési Bizottság) was established in 1962 and was given full responsibility for the bibliographic control and dissemination of scientific and technological information.<sup>29</sup> Its Central Technical Library and Technical Documentation Center (OMKDK - Országos Műszaki Könyvtár és Dokumentációs Központ) was charged with supplying abstracting and indexing services covering both domestic and foreign literature. The Central Technical Library, while providing for the most part traditional library services, forms the basis for the work of the Technical Documentation Center, which provides abstracts, searches, reviews and translations of scientific and technical literature. Nearly 85,000 abstracts are currently prepared and published in 13 series of reviews covering such fields as physics, chemistry, mining, metallurgy, energy, engineering,

Soviet Diffusion Pattern

electro-technical, textiles, food industry, etc. The abstracts are also available in the form of cards classified according to UDC.<sup>30</sup>

#### East Germany

The indicative abstract in card form has been the principal means for disseminating scientific and technical information in East Germany. The decision to exploit the abstract in this form was made in September 1952 during the first workshop of East German documentalists. DIN A6 (Deutsche Industrie-Norm, 148x150 mm) card size was eventually agreed upon and the make-up for the abstract, form of citation and classification system were made standard for all documentation centers.<sup>31</sup> As of January 1961, a total of 227 documentation centers (Dokumentations-stellen) abstracted more than 5,000 serials and other forms of publication. During the first six months of 1961, 163,861 titles were abstracted.<sup>32</sup> Approximately 18 million cards, 610,000 photocopies and 250,000 microfilms were made available in 1961 to some 14,952 subscribers serviced by the Institute for Documentation of the German Academy of Sciences (Institut für Dokumentation der Deutschen Akademie der Wissenschaften), the principal abstracting and indexing organization for East Germany.

The East German information network consists of central documentation institutes, industrial agencies having information centers, and information sections within industrial enterprises. The Central Institute of Information and Documentation (Zentralinstitut für Information und Dokumentation), created in accordance with a decree issued by the Council of Ministers on August 8, 1963, is responsible for administering the information network in the fields of science, technology, and economics. One of the prime functions of the decentralized industrial information sections is to evaluate and abstract newly acquired literature.<sup>33</sup> Highly qualified personnel are used for abstracting. The completed abstracts are forwarded to the industrial agency information centers for industry-wide and national dissemination in abstract services. More than 130 of such services were issued in 1961 among which are found the major abstracting and indexing journals published by the Institut für Dokumentation: Chemisches Zentralblatt, Technisches Zentralblatt (issued in sections: 1. En-

eigewesen; 2. Chemische Technik; 3. Textiltechnik; 4. Maschinenwesen; 5. Elektrotechnik; 6. Bauwesen; 7. Berg- und Hüttenwesen), and Zentralblatt für Kernforschung und Kerntechnik. The abstracting journal Landwirtschaftliches Zentralblatt (published in sections: 1. Landtechnik; 2. Pflanzliche Produktion; 3. Tierzucht, Tiernährung, Fischerei; 4. Veterinärmedizin) formerly issued by the Institute, is now published by the newly organized Institute of Agricultural Information and Documentation, which is responsible to the Academy of Agricultural Sciences (Deutsche Akademie der Landwirtschaftswissenschaften).

#### Soviet Union

Few are the Soviet documentalists who, in discussing dissemination of scientific and technological literature, would fail to invoke the writings of Lenin. A recent textbook prepared by high-ranking staff members of the All-Union Institute of Scientific and Technical Information, cites Lenin as follows:

V. I. Lenin pointed out that success in fulfilling the projected Program of the Party for the development of science, the economy and education would depend in large measure on the creative study and utilization of everything of value to be found in scientific and technical achievements and industrial experience of advanced capitalist countries. He taught that the results of theoretical and experimental research of Soviet scientific establishments and institutions should be evaluated in relation to the level of worldwide achievements in science and technology. V. I. Lenin emphasized that to accomplish these goals, we must 'take over everything of real value which European and American science has to offer; - this is our first and most important mission.' From the sum total of measures directed toward assuring the fulfillment of planned tasks for the development of Soviet science and the creation on its foundation of a socialist economy, V. I. Lenin specifically singled out the task of studying thoroughly all aspects of world literature with the aim of disseminating information on the newest achievements of science and technology and introducing this knowledge into socialist production.<sup>34</sup>

The services of the All-Union Institute of Scientific and Technical Information (Vsesoyuznyy Institut Nauchnoy i Tekhnicheskoy

#### Soviet Diffusion Pattern

Information. VINITI plays a fundamental role in diffusing newly acquired scientific and technical information. Founded in accordance with a resolution of July 19, 1952 issued by the USSR Council of Ministers (Sovet Ministrov),<sup>35</sup> the Institute was asked to undertake

systematic and exhaustive abstracting of all world literature in the fields of natural sciences and technology (astronomy, geodesics, mathematics, mechanics, cybernetics, physics, chemistry, bio-chemistry, biology, acoustics, geography, geology, mining engineering, machine-building, transportation, automation, radio-electronics, electrical engineering, power engineering and industrial economics), on the basis of the above to prepare and publish abstract journals (Referativnyi Zhurnal), to issue review-bibliographies, reference literature and spot reports on the most timely topics, and also to organize and develop scientific research directed toward the improvement of the methods and techniques currently used in scientific information service.<sup>36</sup>

From a total of four series (Astronomy, Chemistry, Mathematics, Mechanics), containing 14,466 abstracts published during the initial year of publication of 1953, the major Soviet abstracting and indexing service, Referativnyi Zhurnal, rapidly increased in scope (see Table 3 and Figure 9). Approximately 17,000, or more than one third of the world's total output of 45,000 scientific and technical journals, as well as a great quantity of other scientific literature, is processed by the Institute. Materials are received and analyzed from more than a hundred countries covering 64 languages of which 22 are from within the Soviet Union. The Institute has a permanent staff of about 2,500, many of whom are highly qualified scientists and engineers. Advisors from Soviet research organizations and industrial enterprises aid in the fulfillment of VINITI tasks. Approximately 22,000 specialists can be called upon to prepare abstracts.<sup>37</sup>

During 1967, Referativnyi Zhurnal expects to publish 25 series and 800,000 abstracts. The centrally processed and published abstracts are often repackaged and distributed in the form of sub-sections of the main subject series. A total of 134 sub-sections will be issued in 1967. (See Table 8A, Appendix A). In addition, 35

#### Soviet Diffusion Pattern

separate subject volumes will be compiled and disseminated (See Table 8B, Appendix A). High selectivity is employed for journal titles abstracted in the VINITI services. Of a total of 2,967 new serial titles received and reviewed during 1963, only 787 were abstracted.

The abstracting and indexing services have, since 1958, been supplemented by Ekspress Informatsiya (Express Information), and Itogi Nauki (Review of Science), which began in 1962, as well as by other publications in the field of bibliography, library science and documentation. Ekspress Informatsiya, a selective current awareness bulletin, provides extensive and often illustrated abstracts of items considered to be of particular significance to Soviet science and industry. A total of 30 such series were issued in 1957. The Institute expects to publish 68 series during 1967.

The Institute has apparently kept pace with the general increase in the quantity and diversity of the world's scientific and technological literature, and substantial effort and resources have been devoted to this task. How widely have the resulting abstracting and indexing services been distributed within the Soviet Union? Which segments of the communist and non-communist scientific communities have made use of these services?

The impression has been created in the non-Soviet literature, 38, 39, 40 which may have been occasioned by rare criticism in the Soviet press, 41, 42 that an inadequate number of copies is printed of Referativnyi Zhurnal, that the cost of the service is prohibitive to Soviet users, and that a substantial portion of the copies printed are sold to Western subscribers to the detriment of Soviet scientific and technical personnel. The factual basis for these statements has not been fully established in the past.

Direct and indirect evidence indicates that the Soviet scientific community relies heavily on Referativnyi Zhurnal as a basic medium for the communication of scientific and technical information. At the Sixth Scientific Conference of the Library of the USSR Academy of Sciences held in Leningrad in 1960, it was noted:

Many scientific institutions and industrial establishments

make ever greater use of its VINITI materials to speed up their scientific and planning work and to learn about new technological processes and progressive work methods.

For example, the factory, "Romel'mash," has been trying for a long time without success to obtain higher strength cast iron well suited to heat processing. This problem was solved only after information contained in an abstract from Metallurgy was utilized. The same factory examined material from Chemistry and was able to set up production of fast drying bonds in a period of two weeks.

A number of enterprises adopted new technological processes, equipment, and devices after studying materials of the All-Union Institute of Scientific and Technical Information and achieved considerable savings as a result. For example, the Kuibyshev Plant, "KATEK," introduced a new method of sealing automobile spark plugs using volatile inhibitors developed as a result of VINITI materials. Savings amounted to 15,000 rubles per year.

Savings by many establishments that have used information from Abstract Journals come to hundreds of thousands of rubles.

The scientific information of VINITI helped the scientists of the Kuibyshev Industrial Institute to solve an important, practical problem about the origin of static electricity in large oil reservoirs and ways of removing it. Introduction of pressing of refractories in a closed drum permitted considerable improvement of quality in this material and resulted in savings of more than 300,000 rubles.

The growth in the number of readers of the Abstract Journals can be judged by the fact that in the past year, the VINITI photographic laboratory filled orders for 660,000 photostats and 648,000 microfilm reproductions of original articles included in the Abstract Journal. The translation office completed orders for translations of 4,700 authors' sheets of text and, taking into account repeat orders, sent out 18,000 authors' sheets<sup>43</sup> of translations.<sup>44</sup>

Individual comments, while in some instances critical of the time lag between the publication of research papers and their appearance in Referativnyi Zhurnal, were for the most part laudatory.

Thus, for example, Referativnyi Zhurnal was said to be heavily used by scientists and students in the Gorki Library of Odessa.<sup>45</sup> A representative of the Saltykov-Shchedrin State Public Library, one of the largest public libraries in the Soviet Union, referred to the "tremendous popularity" of Referativnyi Zhurnal.<sup>46</sup> The distribution policy for Referativnyi Zhurnal and other VINITI services may be inferred from the following statement in a brochure describing the photoreproduction service for items listed in Referativnyi Zhurnal:

The publications of VINITI are the most important and accessible sources of information for a wide circle of the scientific-technical intelligentsia. They are distributed to the scientific and technico-engineering workers of the scientific research institutes and organizational projects or construction bureaus, to the leading workers in the Sovnarkhozy (Soviet People's Enterprises), industrial combines, factory laboratories and experimental stations, as well as to the professional and technical staff, the aspirants and the students of the higher educational institutions.<sup>47</sup>

The statement quoted above indicates that the allegation that distribution is based solely on paid subscriptions is erroneous.<sup>48</sup>

Album and Hoshovsky say in reference to Referativnyi Zhurnal:

What about the distribution of the Soviet Abstracts Journal? Would they really use 3,000 full-time workers and 20,000 part-time abstractors to publish their best abstracting journal and then fail to distribute it properly? Would they print only a few copies and then ship a large percentage of these out of the country thus leaving the desks of their engineers and scientists bare? We think not.<sup>49</sup>

The authors cite information indicating that the actual number of recipients of Referativnyi Zhurnal - Khimika is roughly three times the figures published in the open press.<sup>50</sup>

Misinformation about Soviet distribution figures for Referativnyi Zhurnal may be intentional. When responding to inquiries by members of a U. S. delegation visiting VINITI in October 1959, Soviet officials indicated that about 2,000 copies of Referativnyi Zhurnal - Mashinostroenie (Machine Construction) were printed,<sup>51</sup> but attendees of a Soviet Seminar for Workers for Scientific and Technical

#### Soviet Diffusion Pattern

Information, held in Moscow in May 1960, were told that the Ma-  
shinoestroenie series of Referativnyi Zhurnal had 1,459 subscribers  
in 1959, and that after subdividing this series and issuing it also in  
16 subsections in 1960, the number of subscribers was increased to  
19,000.<sup>51</sup> During this seminar the following overall foreign sub-  
scriber statistics for Referativnyi Zhurnal for the year 1960 were  
released:<sup>52</sup>

#### "Referativnyi Zhurnal" Foreign Subscribers, 1960

Country	Ref. Zh. Subscribers	Percent
National Democracies (Soviet bloc, Europe)*	8,959	36.0
Yugoslavia	452	1.8
China (Mainland)	10,655	42.8
Korea (North)	2,250	9.0
Vietnam/Mongolia	370	1.5
United States	847	3.4
Great Britain	383	1.5
France	395	1.6
West Germany	232	0.9
Japan	354	1.4
	24,897	99.9

\*Information in parentheses added by author.

In an effort to gain some first hand information regarding  
VINITI distribution policy and extent of distribution of VINITI ser-  
vices, the author communicated with VINITI officials. While few  
data not already published in the Soviet and foreign press were thus  
obtained, Y. N. Sorokin, Deputy Director of VINITI, stated that for  
the approximately 160 sub-sections published, each containing from  
eight to ten author sheets, the "average circulation equals approx-  
imately 2.5-3 thousand copies."<sup>53</sup> The total number of domestic and  
foreign subscribers to Referativnyi Zhurnal has been stated to be  
400 thousand.<sup>54</sup>

If one subtracts from the above figure the approximately  
25,000 foreign subscribers, accepting the subscriber figures cited,  
that leaves a total of 375,000 or 93.8 percent of domestic Soviet  
Union subscribers to Referativnyi Zhurnal.

#### Soviet Diffusion Pattern

As indicated by the table of foreign subscriptions, Referativnyi Zhurnal is distributed to all foreign communist institutions and individuals that can derive even the slightest benefit from this service. Even a relatively small and unindustrialized country such as North Korea received almost three times as many subscriptions as were mailed to the United States. The subscriptions mailed to European Soviet bloc countries totalled more than four times the number received by all the Western powers combined. The number of subscriptions mailed to China in 1960 was almost 13 times the number sent to the United States.

Self-criticism, formal evaluations, as well as official decrees stemming from the Council of Ministers provide the drive toward maximum exploitation of available information. While the results of evaluation of Referativnyi Zhurnal are not generally made available, it is known that such evaluations are made regularly. The quality and usefulness of the service is assessed through the following methods:

- a. Questionnaires are sent to the Institutes of the Academy of Sciences.
- b. Each autumn, 40-50 VINITI staff visit the economic councils (Sovnarkhozy), the large industrial enterprises and technological research institutes to secure subscriptions and to receive comments and criticism.
- c. Periodical readers' conferences are organized on a regional basis in the main subject fields. For example, on 11th June 1963, a chemical conference was held in Moscow by VINITI in conjunction with the Lenin Library, with 16 speakers and an attendance of 200; Professor Mikhaïlov spoke on the work of the chemistry department of VINITI, and the role of Ekspress Informatsiia ('Express Information') in putting out organic chemical abstracts quickly was discussed; the indexing of formulae and the lateness of abstracts generally were also considered.<sup>55</sup>

The Council of Ministers resolution of May 11, 1962 relating to measures for improving the organization of scientific and technical information within the Soviet Union required a review of

#### Soviet Diffusion Pattern

activities of VINITI and of those of a number of central branch institutes and scientific and technical libraries, ministries, and state committees providing information services. A conference of 18 high ranking officials responsible for the fulfillment of the resolution was held in Moscow on April 10, 1964, and a report was made on the degree to which the Council resolution had been implemented.<sup>56</sup>

While VINITI was singled out and praised for its "efficiently organized preparation and publication of information materials,"<sup>57</sup> considerable criticism was heaped upon it and other Soviet institutions for the undue time lag between receipt of scientific and technical information and its appearance in the abstracting and indexing services:

In the V. S. Malov report, a large number of facts are given of impermissible delays in preparation and publication of information. Subjected to sharp criticism is the work of VINITI, TsINTIPshcheprom [Central Institute of Scientific and Technical Information of the Food Industry], TsINTILegprom [Central Institute of Scientific and Technical Information for the Light Industry], TsINTIAM [Central Institute of Scientific and Technical Information on Automation and Mechanical Engineering], institutes of scientific and technical information of the RSFSR and Ukrainian SSR, TsBTI [Central Bureau of Technical Information] of Middle Ural Sovnarkhoz and others. It would be possible to give a great number of examples when 10-12 months or more are required for processing and publication of information. Delays such as these discredit the idea of organization of a system of scientific and technical information.<sup>58</sup>

By decree No. 775 dated September 10, 1964, the Council of Ministers set time limits for publishing Referativnyi Zhurnal at 3 to 4 months and Ekspress Informatsiya at one month from the time the original source material is received. An earlier decree of the Council of Ministers (no. 418) directed that abstracts be delivered to VINITI within 10 days of acceptance of materials for printing. With such action it was hoped in some cases to publish and disseminate abstracts prior to original publication of documents or journal articles.<sup>59</sup>

Not content with the dissemination of abstracts in journal form, Soviet documentation centers have begun reissuing abstracts

#### Soviet Diffusion Pattern

in card format. Standardized formats (75x125 mm) were adopted for abstract cards by all documentation centers. With the publishing of Referativnyi Zhurnal in 1953, such previously existing card services as Tekhkart (Technical Card), issued by the State Scientific Library, were discontinued. Arguments for disseminating abstracts in card vs. journal format, or both, have been revived and are being pursued vigorously.<sup>60</sup>

Regardless of the format, there is no question that intense effort is being exerted to provide prompt abstracting, indexing and dissemination of pertinent information to the Soviet scientific community. A delegation of British librarians and information specialists, having visited Soviet information centers, including VINITI, reported:

The main impression we derived from our visit was the sense of urgency and importance which is accorded in the Soviet Union to all aspects of the preparation, publication and dissemination of the results of scientific research and development and the flow of technical information to industry. . . . The organized supply of scientific and technical information is an essential part of the centralized control of research and development in support of national plans for industrial production.<sup>61</sup>

Diffusion of information as an integral part of research has been accepted and practiced in the Soviet Union for many years. The theoretical bases for this practice are deeply rooted in fundamental communist dogma.

#### Summary

Abstracting and indexing services have traditionally played a vital role in the information diffusion process. The increased growth in scientific and technological reporting, the physical impossibility and inordinate cost of reviewing unorganized literature, the pressures of time on the modern researcher, have all contributed to making the abstracting and indexing service a basic medium for current awareness and an essential key to retrospective scientific and technical information.

Primary distribution of full size copies of the technical report literature, carried out for the AEC, NASA, and DOD by their

#### Soviet Diffusion Pattern

respective agency contractors and national documentation centers, has been quite limited in the past and, within recent months, has been further curtailed in favor of microfiche. At best, such distribution is confined to institutions and organizations with a demonstrated need, or having an official connection with Federal government agency activities. Frequently, however, it is difficult, if not impossible, to predict the usefulness or the application that can be made of research results. For wider dissemination of R & D results, particularly to the non-defense-oriented research community, Federal agency documentation centers are increasingly relying upon the abstract as a basic communication medium.

National documentation centers established in Poland, Czechoslovakia, Hungary, East Germany and the Soviet Union have made extensive use of the abstract in both card and journal format as their official medium for scientific and technological communication. The Soviet abstracting and indexing service, Referativnyi Zhurnal, during the year 1967, is expected to publish 800,000 abstracts to be distributed in 25 series, 134 sub-sections and 35 separate independent volumes. Of the approximately overall total of 400,000 recipients of Referativnyi Zhurnal, about 375,000 are within the Soviet Union. Distribution is directed to scientists, engineers, and technical personnel at many professional, scientific and industrial levels, including personnel employed in industrial combines, factory laboratories, experiment stations, as well as to students and candidates for higher degrees in Soviet educational institutions. Heavy reliance is placed upon the abstracting and indexing services. Available evidence on foreign dissemination indicates that distribution of Referativnyi Zhurnal is purposefully channeled to Communist nations.

35. The Institute initially consisted of a Scientific Information Section having responsibility for the preparation of abstracts, an Editorial Board preparing materials for publication, a Production and Publishing Branch, and a Technical Section. The Institute was placed under administrative control of the Publishing House, Academy of Sciences of the SSSR. Toward the end of 1955 it was reorganized into the All-Union Institute for Scientific and Technical Information under the dual administrative jurisdiction of the Academy of Sciences and the State Scientific and Technical Committee (GNTK) of the Council of Ministers, U. S. S. R. Further reorganization in April 1961 placed the Institute under control of the State Committee for the Coordination of Scientific Research, which had been given overall responsibility for information processing. In September-October 1965, changes promulgated by the Central Committee of the Communist Party created a new State Committee for Science and Technology which now has jurisdiction over the Institute.

## Chapter 4

### Diffusion Pattern for NSA, STAR, TAB, and USGRDR

Both public and private agencies have indicated concern about adequate bibliographic control, abstracting, indexing, and dissemination of the technical report literature stemming from U. S. financed research. Substantial intellectual and material resources have been committed by the Federal government toward the attainment of these objectives. During fiscal year 1967, it is estimated that 273 million dollars will be obligated by the Federal government for scientific and technical information of which approximately 30 percent will be devoted to "publication and distribution" (See Figure 10).

The U. S. Federal Council for Science and Technology took cognizance of the progress made to date and of the vital role played by abstracting and indexing services in the information diffusion process:

The Federal agencies have made significant strides in the improvement of abstracting-indexing mechanisms for the announcement and availability of Government research reports. The importance of advances in this area of information handling is underlined by the fact that abstracting-indexing is a principal means available for providing scientists with current awareness of their fields of interest as well as guides for retrospective search of the world's literature. In brief, abstracting-indexing of the significant literature is central to effective scientific research services both within and outside Government.<sup>1</sup>

"Prompt and informative abstracting and indexing" as well as "prompt announcement on the broadest scale... both within the Department of Defense and the rest of the U. S. technical community, commensurate with security needs" are basic recommendations of a Department of Defense study on scientific and technical information.<sup>2</sup> The "Weinberg" report opens with the statement: "Transfer of information is an inseparable part of research and development."<sup>3</sup> What, then, is the current distribution pattern for the four major Federal abstracting and indexing services of NSA, STAR, TAB, and USGRDR?

## U. S. Diffusion Pattern

Which industries, subject disciplines or geographic regions are the primary recipients of the services?

One of the first tasks confronting the investigator in seeking answers to the above questions was to obtain mailing lists for the

Figure 10

Federal Obligations for Scientific and Technical Information,  
by Agency and Performer, 1967 (est.)

Source: U. S. National Science Foundation. Funds for Research, Development and Other Scientific Activities, 1967. (NSF 66-25). Washington, D. C., U. S. Govt. Print Off., 1966, p. 47.

recipients of each of the abstracting and indexing services under study. Understandably, a good deal of caution was exercised by Federal agencies before releasing recipient or subscriber information for government publications. Correspondence, personal visits, sufficient assurance that the mailing lists would be used solely for research purposes eventually yielded the following recipient files:

### Recipient Files

1. Official Distribution List, TAB

U. S. Diffusion Pattern

Source: Defense Documentation Center, Cameron Station, Virginia  
No. of Addresses: 3,473  
Format: Computer printout, arranged by DDC user code number  
Date of File: June 13, 1965  
Coding: User code; type of institution; facility clearance; number of TAB copies; number of TAB indexes.

2. Official Distribution List, NSA  
Source: U. S. Atomic Energy Commission, Division of Technical Information Extension, Oak Ridge, Tennessee  
No. of Addresses: 1,420  
Format: Computer printout, arranged by AEC computer filing code  
Date of File: December 31, 1965  
Coding: Type of recipient; computer filing code; number of NSA copies
3. Official Distribution List, STAR  
Source: National Aeronautics and Space Administration, Washington, D. C.  
No. of Addresses: 4,103  
Format: Computer printout (Master Address Authority List), arranged by NASA user code  
Date of File: October 11, 1965  
Coding: Coding indicating the number of copies mailed to each recipient was withheld by NASA.
4. Subscriber List, NSA  
Source: U. S. Government Printing Office via U. S. Atomic Energy Commission, Washington, D. C.  
No. of Addresses: 1,673  
Format: Elliott addressoplate printout sheets containing 10 addresses each, arranged alphabetically, by state  
Date of File: July 13, 1965  
Coding: Number of copies, service, subscription expiration date.
5. Subscriber List, USGRDR  
Source: U. S. Government Printing Office via Clearinghouse for Federal Scientific and Technical Information, Springfield, Virginia  
No. of Addresses: 3,071  
Format: Elliott addressoplate printout sheets, containing 10 addresses each, arranged alphabetically, by state  
Date of File: August 19, 1965  
Coding: Number of copies; services, subscription expiration date.
6. GPO Depository Library Recipients, NSA, STAR, USGRDR  
Source: U. S. Government Printing Office, Washington, D. C.  
No. of Addresses: 302 NSA recipients  
                  398 STAR recipients  
                  459 USGRDR recipients  
Format: Elliott addressoplate printout sheets containing 10 addresses

# U. S. Diffusion Pattern

each, arranged alphabetically, by state

Date of File: August 10, 1966

Coding: Number of copies; service.

7. Smithsonian Institution Exchange Recipients, NSA, STAR, USGRDR  
Source: International Exchange Service, Smithsonian Institution, Washington, D. C.

No. of Addressees: 59 NSA recipients

59 STAR recipients

59 USGRDR recipients

Format: A listing of institutional recipients of full sets of official United States government publications, as recorded on pp. 148-50 of the Report on the International Exchange Service for the year ending June 30, 1965.

Date of File: Transmitted via Smithsonian International Exchange Letter of October 4, 1966

Coding: Number of copies.

8. Library of Congress Exchange Recipients, NSA, STAR, USGRDR  
Source: Exchange and Gift Division, Library of Congress, Washington, D. C.

No. of Addressees: 31 NSA recipients

5 STAR recipients

44 USGRDR recipients

Format: Addressoplate printout mailing labels

Date: October 27, 1966

Coding: None.

9. Subscriber Data: STAR  
Source: U. S. Government Printing Office, Washington, D. C.  
No. of recipients: 300  
Format: Private communication providing data, by state and subject, for the number of STAR subscribers and number of copies received. No addressees were disclosed. A total of 125 U. S. subscribers to STAR represented all U. S. subscribers (Federal and non-Federal) out of an overall total of 300 for all subscribers receiving 345 copies of STAR  
Date of File: March 21, 1966  
Coding: Broad subject grouping; number of copies; distribution by state.

The total number of recipients (i. e., addressees) obtained for all four services is summarized as follows:

Table 4  
Total Recipient File, by Source

Source File	No. of Recipients	Percent
Official Distribution, TAB	3,473	22.18
Official Distribution, NSA	1,420	9.07

# U. S. Diffusion Pattern

Source File	No. of Recipients	Percent
Official Distribution, STAR	4,103	26.21
Subscribers, NSA	1,673	10.69
Subscribers, USGRDR	3,071	19.62
GPO Depository Library Distribution	1,359	8.69
Smithsonian Exchange Distribution	177	1.13
LC Exchange Distribution	80	.51
Subscribers, STAR	300	1.92
Total	15,656	100

The comprehensive recipient file was combined and rearranged into the following segments:

Table 5  
Total Recipient File, by Segment

Recipient Group	No. of Recipients	Percent
Non-Federal U. S. Recipients	8,074	51.57
Federal Recipients	2,822	18.03
GPO Depository Libraries (Federal and Non-Federal)	1,359	8.68
Foreign Recipients	3,401	21.72
Total	15,656	100

The file for domestic U. S. recipients<sup>4</sup> contained 12,255 recipients of which 11.09 percent were GPO Depository Libraries, 23.03 percent Federal recipients, and 65.88 percent non-Federal U. S. recipients.

While the primary aim of this study has been to analyze the private, non-Federal U. S. recipient population, to acquire adequate statistical background and perspective, it was necessary to examine all of the above groups in some detail.

## Non-Federal U. S. Recipients

The Non-Federal U. S. Recipient File of 8,074 addresses included industrial organizations, educational and nonprofit institutions, state and local government agencies, and unaffiliated private subscribers or individuals. The addresses were standardized and arranged alphabetically under corporate name of the recipient, with divisions or sub-units grouped under the corporate entry. Unaffiliated

#### U. S. Diffusion Pattern

private recipients were filed under the last name of the recipient. Each corporate or private recipient entry was assigned a unique five digit number (0-99999) identifying the organization, institution, or non-corporate private addressee. An additional two digits (0-99) were used as part of the number to identify subdivisions or affiliates grouped under the corporate entry. The entire file was coded and the data keypunched on standard EAM equipment.

The coding system was designed to enable the investigator to group and permute the characteristics of the recipients. Of considerable importance was the determination and eventual analysis of such latent variables as number of institutions or industries dealt with, as well as number of geographic locations or sites receiving one or more of the abstracting and indexing services under study. It is obvious that more than one recipient may be found within a single industrial organization or educational institution and that more than one site can be utilized by such an organization or institution, its subdivisions and affiliates.

For each address, in addition to corporate accession number and sub-unit identification, codes were assigned for the following:

1. Type of organization or institution
  - a. Industrial
  - b. Educational/Nonprofit
  - c. State and local government
  - d. Unaffiliated private recipient
2. Industry classification.  
Based on the Standard Industrial Classification Manual (U. S. Office of Statistical Standards, 1957 ed. and supplements) a three digit industry classification number was assigned for each corporate entry.
3. COSATI subject category classification  
A four digit subject classification number was assigned for each recipient. The DOD-extended COSATI Subject Category List (Defense Documentation Center, 1965) was employed for this purpose.
4. Abstracting and indexing service received
  - a. NSA
  - b. STAR
  - c. TAB
  - d. USGRDR

#### U. S. Diffusion Pattern

5. Number of copies received
6. Attention line for service
  - a. Library
  - b. Information center
  - c. Security officer
  - d. Individual (other than above)
  - e. None
7. Geographic location

A two digit code was assigned to designate the U. S. state location for each recipient. An additional two digits were used to differentiate between various organization or institution sites within any one state.
8. Source of Receipt
  - a. Subscriber
  - b. AEC distribution
  - c. DDC distribution
  - d. NASA distribution
  - e. Exchanges
  - f. Depository distribution
  - g. Other distribution

All keypunched data were converted to magnetic tape and analyzed with the aid of a Control Data Corporation computer, CD1604-A.

Analysis of the non-Federal U. S. Recipient File revealed that two thirds of the total of 7,949 recipients<sup>5</sup> were in industrial organizations, 30.4 percent in educational and nonprofit institutions, 2.3 percent were private subscribers or individuals having no apparent institutional affiliation, and a small fraction (0.7 percent) were state and local government recipients (Table 6). Thus 97 percent of all non-Federal U. S. recipients were within industrial organizations and educational institutions, with the former in the majority.

When the distribution pattern is examined in terms of the individual services, it is apparent that four fifths of the USGRDR recipients, a somewhat lesser portion of TAB and STAR recipients, and less than half of NSA recipients are industrial organizations. Of course, there are many more industrial organizations extant than there are educational institutions<sup>6</sup> and this would tend to account for the preponderance of STAR, TAB, and USGRDR recipients within industrial organizations. The almost equal distribution of NSA among industrial and educational recipients may be attributed in part to the

#### U. S. Diffusion Pattern

comparatively heavy use made of NSA by pure scientists, particularly biologists, medical personnel and physicists (Table 11A, Appendix A). This type of user is found in the educational rather than industrial environment (Table 10A, Appendix A).

The 7,949 non-Federal U.S. recipients were associated with 3,004 separate industrial, educational or nonprofit organizational units in 4,179 different sites or geographic locations. The organizational recipient breakdown is as follows:

		Percent
Industrial Corporations	2,154	71.7
Universities	184	6.1
Colleges	169	5.6
Junior Colleges	13	0.4
Independent Libraries	56	1.9
Foundations	20	0.7
Hospitals	42	1.4
Institutes	41	1.4
Museums	4	0.1
Professional Associations	40	1.3
Business Associations	43	1.4
State Government	41	1.4
Local Government	5	0.2
Private or Unaffiliated Recipients	183	6.1
Other Recipients	10	0.3
Total	3,004	100

#### COSATI Subject Grouping

Disregarding for the present institutional or organizational affiliation and grouping the entire non-Federal U.S. recipient population within broad COSATI subject categories,<sup>7</sup> we find, in rank order, that the largest recipient groups for the combined services are in the field of Electronics and electrical engineering (14.04 percent), followed closely by the fields of Mechanical, industrial, civil and marine engineering (13.45 percent), Materials (10.68 percent), Biological and medical sciences (7.87 percent), Aeronautics (5.10 percent), Chemistry (5.0 percent) (See Table 7). Practically all of the categories listed above are representative of subject fields which are the primary recipients of R & D funds and generally denote those industries which are in the forefront of economic expansion.

From the more detailed breakdowns arranged under four digit

(a) Excludes subject analysis for 183 private/official recipients.

COSATI subject groups (Table 9A, Appendix A), we learn of the predominance of particular subject groupings within the broader COSATI subject fields. Thus, for example, within the Materials field, the subject groups Metallurgy and metallography, and Ceramics, refractories, and glasses, constitute the most numerous recipient groups, while such groups as Fibers and textiles or Wood and paper products, found in other studies to represent industries having relatively small portions of R & D expenditures as percentage of sales or

#### U. S. Diffusion Pattern

net industrial output (See Table 2A, Appendix A), constitute some of the smallest recipient groups; within the subject field Biological and medical sciences, following the subject group Clinical medicine, Pharmacology is the most numerous recipient group. As in the case of the other major recipient fields of Electronics and electrical engineering, Chemistry, and Aeronautics, the field of Pharmacology is representative of a research-oriented and fast-growing segment of the industrial community.

Expected and rather distinct differences appear in the subject orientation of the industrial and educational portions of the recipient population (Table 10A, Appendix A). While the fields of Electronics and electrical engineering, Materials, Mechanical, industrial, civil, and marine engineering constitute, in rank order, the most populous subject fields for industry with an aggregate of 47.3 percent of industrial recipients, for educational and nonprofit institutions, the primary interest fields, also in rank order, are Biological and medical sciences, Mechanical, industrial, civil and marine engineering, and Physics, accounting for 35.5 percent of the educational and nonprofit institutional recipients. The differences in subject emphasis within each of the 27 COSATI subject fields become apparent as they are reflected in the quantitative differences for the respective recipient populations. Apparent, too, is the more general emphasis on applied sciences in industrial organizations, and pure sciences within educational institutions. Thus, while the field of Materials constitutes 14.6 percent of the industrial recipient population, for educational recipients it constitutes 2.3 percent. On the other hand, for the field of Biological and medical sciences, 15.2 percent of the population is in the educational sector, while 4 percent is in the industrial sector; for Electronics and electrical engineering, 18.2 percent is in the industrial sector, and 3.9 percent in the educational sector, for Physics, 8.1 percent is found to be in the educational sector, and 3.2 percent in the industrial sector.

When the recipient population is examined from the point of view of distribution of the specific abstracting and indexing services among various population segments as grouped under COSATI subject

#### U. S. Diffusion Pattern

fields (Table 11A, Appendix A), it is evident that each of the abstracting and indexing services is received within each of the 27 COSATI subject fields. Thus, apparently, recipients in each of the COSATI subject fields hope to obtain pertinent information from each of the abstracting and indexing services of NSA, STAR, TAB, and USGRDR. The mission rather than the subject-orientation of the services is certainly underscored by these data. Conversely, each of the abstracting and indexing services of NSA, STAR, TAB, and USGRDR is received within a broad range of subject disciplines. The subject field rankings of the respective recipient populations for these services bear only a slight relationship to the subject fields generally thought to be directly pertinent to the missions of the Federal agency issuing agencies. The combined fields of Space technology and Aeronautics account for only 10.6 percent of the STAR recipient population. However, these fields also constitute 9.0 percent of TAB recipients, 4.6 percent of NSA recipients, and 4.8 percent of USGRDR recipients. The recipient population data indicate the subject disciplines essential in carrying out the respective Federal documentation center agency missions and, consequently, the major recipient subject fields for STAR are found to be within the fields of Mechanical, industrial, civil, and marine engineering, containing 17.3 percent of the STAR recipient population, Electronics and electrical engineering with 12.7 percent, Aeronautics with 8.6 percent, and Materials with 7.4 percent. For TAB and USGRDR, though place rankings undergo some change, the above fields also constitute major recipient groups. The field of Electronics and electrical engineering comprises 19.9 percent of the TAB recipients, the field of Mechanical, industrial, civil and marine engineering 10.8 percent, the defense-oriented field, Navigation, communication, detection, and countermeasures 8.7 percent, and the Materials field 7.0 percent. When one excludes the "General" category with 14.1 percent of recipients, the greatest number of NSA recipients is concentrated, in rank order, in the fields of Biological and medical sciences with 18.1 percent, Materials with 9.8 percent, Nuclear science and technology with 9.0 percent, Chemistry with 7.8 percent, Mechanical, industrial, civil, and

#### U. S. Diffusion Pattern

marine engineering with 6.7 percent, and Physics with 6.5 percent.

#### Geographic Distribution

The states of California, New York, and Massachusetts, in that order, account for 35.88 percent of all recipients. When one adds to the above the states of Pennsylvania (6.97 percent) and New Jersey (5.47 percent), nearly half of the abstracting and indexing service recipient population have been accounted for. Eighteen states total only 3.41 percent of the recipients. These are: Alaska, Arkansas, Hawaii, Idaho, Maine, Mississippi, Montana, Nebraska, Nevada, New Hampshire, North Dakota, Rhode Island, South Carolina, South Dakota, Utah, Vermont, West Virginia, Wyoming, each with less than one half of one percent of the recipient population. Thirteen additional states each contain less than one percent of the recipient population (Table 12A Appendix A).

While the heavy concentration of recipients in California, New York, Massachusetts, etc., may be explained in part as a result of their relatively large populations, as may be seen from Tables 13A and 14A, Appendix A, these states also rank high in Federal R & D contract allocations and also in terms of number of scientists and engineers employed as a percentage of the total labor force. Significantly, though no cause and effect relationship is implied, states having a high industrial recipient population generally are also found to have a high educational recipient population (Table 15, Appendix A) and within the educational recipient sector, we again note the top ranking industrial recipient states of New York (13.01 percent), California (10.71 percent), Massachusetts (7.9 percent), Illinois (6.16 percent), Pennsylvania (5.87 percent), and Ohio (4.38 percent).

Distribution of the individual services of NSA, STAR, TAB, and USGRDR conforms for the most part to the overall geographic pattern established for all the services. In ranked order, recipients in the top seven states, by service, are located geographically as follows:

NSA	STAR	TAB	USGRDR
New York	Calif.	Calif.	New York
Calif.	New York	New York	Calif.
Penn.	Penn.	Mass.	Penn.

# U. S. Diffusion Pattern

Mass.	Mass.	Penn.	New Jersey
Ohio	Ohio	New Jersey	Illinois
Illinois	Illinois	Ohio	Mass.
New Jersey	New Jersey	Maryland	Ohio

When the geographic distribution by state is examined for each service within the industrial or educational recipient sectors (Tables 17A-18A, Appendix A), with minor exceptions, the same states attain top recipient ranking for each of the abstracting and indexing services. These rankings hold equally well when looked at from the point of view of industrial or educational segments of the recipient population:

## Comparison Ranking Industrial Recipients

<u>NSA</u>	<u>STAR</u>	<u>TAB</u>	<u>USGRDR</u>
Calif.	Calif.	Calif.	New York
New York	New York	New York	Calif.
Penn.	Penn.	Mass.	Penn.
New Jersey	Mass.	New Jersey	New Jersey
Ohio	New Jersey	Penn.	Illinois
Mass.	Ohio	Ohio	Mass.
Illinois	Maryland	Maryland	Ohio

## Comparison Ranking Educational Recipients

<u>NSA</u>	<u>STAR</u>	<u>TAB</u>	<u>USGRDR</u>
New York	New York	New York	Calif.
Calif.	Calif.	Calif.	New York
Penn.	Illinois	Mass.	Mass.
Mass.	Mass.	Penn.	Penn.
Ohio	Penn.	Illinois	Indiana
Illinois	Michigan	Maryland	Illinois
Michigan	Ohio	Ohio	Ohio

A regional grouping of recipients (Table 19A, Appendix A) reveals that the East South Central, Mountain, West North Central and West South Central regions, in that order, rank lowest in number of recipients, while the Middle Atlantic, Pacific, and East North Central regions have top ranking. When the regional percentage distribution of recipients is compared with the distribution of such economy input variables as total R & D funds, industrial R & D funds, percent of doctorates employed, percent of scientists in Federal government

### U. S. Diffusion Pattern

work, a definite relationship is found to exist between the regional geographic distribution of the abstracting and indexing services under study and the other factors listed (See Table 8).

Table 8  
Regional Percentage Distribution of Non-Federal U. S.  
Recipients Compared to Percentage Distribution of  
Other Variables

	Percent Recipients	Percent Total R & D Funds 1963	Percent Manufacturers 1963 (Pre-1) 8	Percent Industrial R & D Funds 1964 9	Percent of Scientists in Fed. Govt. Work 1942 10	Percent Doctorates Employed 1962 11
Middle Atlantic	25	23	26	23	23	24
Pacific	18	15	14	20	15	15
East North Central	17	16	20	17	16	18
South Atlantic	13	15	11	7	15	15
New England	11	4	8	8	7	8
West South Central	5	7	7	6	6	6
West North Central	4	6	7	4	6	6
Mountain	4	6	3	3	6	5
East South Central	3	3	5	2	3	3

### Copy Distribution

Data on the number of copies disseminated were available only for NSA, TAB and USGRDR. For the 5,231 non-Federal U. S. recipients of the above services, a total of 11,243 copies were distributed, or an average of 2.15 copies per recipient.<sup>12</sup> A detailed analysis of the ratio of recipients to number of copies received reveals that 80.7 percent of the members comprising the recipient population received one copy each, 8.7 percent 2 copies, 4.8 percent 3 copies, 3.1 percent 4-9 copies, and 2.5 percent 10 or more copies (Table 20A, Appendix A). For USGRDR which is available almost exclusively through paid subscription, the percentage of single copy recipients totaled 96.8 percent, for NSA 87.4 percent, and for TAB 58.5 percent. Obviously, the bulk of multiple copy receipts is confined to those services

U. S. Diffusion Pattern  
 available gratis through official distribution channels. While it is understandable that paid subscribers would order a minimal number of copies of the abstracting and indexing services, it is also certain that unless the recipient organization established a formal mechanism for wider dissemination of the service received, the receipt of a single copy only within the recipient organization would preclude its extensive use for current awareness purposes. Certainly this generalization may well be applicable to USGRDR recipients.

From a comparison of the geographic distribution of recipients, by state (Table 12A, Appendix A) and a similar distribution of copies for NSA, TAB, and USGRDR (Table 21 A, Appendix A) it can be concluded that the geographic distribution pattern for non-Federal U. S. recipients and number of copies is quite similar. Although some of the rankings undergo change, the highest ranked seven states appear in both listings:

<u>States by No. of Recipients</u>	<u>States by No. of Copies</u>
Calif.	Calif.
New York	New York
Mass.	Illinois
Penn.	Mass.
Ohio	Penn.
New Jersey	Ohio
Illinois	New Jersey

When the comparison is made between recipient distribution by type of institution (Table 15A, Appendix A) and copy distribution (Table 22A), Appendix A, the basic distribution pattern remains constant:

<u>Type of Recipient</u>	<u>Percent Copy Distribution NSA, TAB, USGRDR</u>	<u>Percent Recipient Distribution NSA, STAR, TAB, USGRDR</u>
Industrial Organizations	70.9	66.5
Educational/Nonprofit Institutions	27.5	30.4
Private/Unaffiliated	1.2	2.3
State and Local Govt.	0.5	0.7

Some significant differences do appear when the recipient-copy comparison is made by individual service and subject field (Table 11A and Table 23A, Appendix A). While the relative rankings of the top

#### U. S. Diffusion Pattern

subject fields for TAB and USGRDR remain for the most part unchanged, for NSA the changes are pronounced. Thus, for example, the field of Nuclear Science and Technology ranks fourth in the recipient listing (111 recipients representing 8.0 percent of the NSA recipient population), but ranks first in the copy distribution listing (1,526 copies representing 48.6 percent of the total NSA copy distribution). Apparently, unlike copy distribution for TAB and USGRDR, distribution of NSA copies to non-Federal U. S. recipients is concentrated within a small group of organizations. Understandably, several large laboratories operated under contract for the Atomic Energy Commission, such as Argonne National Laboratory, Oak Ridge National Laboratory, Brookhaven National Laboratory, Battelle Northwest Laboratory, receive the bulk of NSA copy distribution. This phenomenon is supported by data in Table 20A, Appendix A indicating five NSA recipients, each receiving more than 100 copies of the relatively small NSA distribution. The differing approaches toward meeting current awareness needs as exemplified by many a large educational institution or industrial corporation receiving a single copy only of any one service, and laboratories operated by industry for the Federal government receiving as many as 300 copies of the pertinent abstracting and indexing service, though not subject to appraisal in this study, are certainly worth further investigation.

#### Industry Classification

What are the characteristics of the recipient industrial population, not in terms of the particular subject disciplines or geographic locations of recipients, but in terms of the specific industrial enterprises with which two thirds of the recipient population is affiliated? It is evident from data in Table 9, a total of 2,154 industrial establishments were represented in the file. Coded in terms of Standard Industrial Classification (SIC), nonmanufacturing industries comprised the largest industrial groups with 27.21 percent of all industrial establishments. A breakdown of these establishments by more detailed SIC headings (Table 24A, Appendix A) revealed that 483 of the 586 industries classed within the nonmanufacturing industries groups were in subgroups 739 and 891. These subgroups represent

# U. S. Diffusion Pattern

codings for independent laboratories and engineering and consulting services whose primary activity is research and development work rather than manufacturing.

The economically expanding manufacturing group of Electrical equipment and communications was in forefront with 18.20 percent of all industrial enterprises represented in the recipient file, followed by Chemical and allied products (9.10 percent), Machinery (9.05 percent), Professional and scientific instruments (7.61 percent), Aircraft and missiles (6.13 percent). It is precisely these industries that received the greatest share of research and development funds during 1964 (See Table 25A, Appendix 4). On the other hand, such industries as Lumber, wood products, and furniture, Textiles and apparel, Paper and allied products, ranked lowest with a recipient file representation ranging from 0.23 to 1.1 percent. The industries, previously established as lagging in the economic race, received the smallest portion of research and development funds.

Table 9  
Industrial Recipient Establishments, by

Other manufacturing industries--tobacco manu- factures (21), printing and publishing (27), leather products (31), and miscellaneous manufacturing industries (39)	97	4.50
Manufacturing industries--Mining (10-12 and 14), contract construction (15-17), trans- portation and other public utilities (40-47 and 49), wholesale and retail trade (50- 59), finance, insurance, and real estate (60-67), and selected service industries (70-79 and 89)	586	27.21
Total	2154	100.00

\* For the purposes of this study, crude petroleum and extraction (13) is grouped with petroleum refining (29), and communication (48) is grouped with electrical equipment (36) in the manufacturing group of industries.

\*\* Companies primarily engaged in the manufacture of ordnance and accessories, including complete guided missiles, are grouped with companies primarily engaged in the manufacture of aircraft and parts because of close similarity of R & D activities carried out by major companies in the two industries.

## Distribution Pattern by Site

NASA and AEC technical reports are announced in USGRDR without abstracts. Format changes for USGRDR instituted in 1967 provide references to STAR and NSA with the hope that needed abstracts may thus be located. To what extent do the USGRDR recipient sites also receive NSA, STAR, or both? To what extent is it necessary for STAR to duplicate in its abstracting and indexing service announcements of reports listed also in TAB? Conversely, what percentage of the TAB recipient sites also acquire STAR, NSA or USGRDR? What are the most prevalent combinations for these

# U. S. Diffusion Pattern

services at the various sites?

For the purposes of this study, a site has been defined and coded for computer input as a specific geographic location which may house one or more buildings (usually having a common address) all reachable within easy walking distance one from the other. Thus, for example, the Columbia University campus at Morningside Heights, New York, would be considered a single site, its Nevis Cyclotron Laboratories at Irvington, New York, another.

A printout of the coded data revealed that the 7,949 non-Federal recipients were located at 4,179 discrete sites. The combination of services, arranged in rank order, is indicated in Table 10. USGRDR is received exclusively at 1,067, or 25.5 percent of all recipient sites, followed by the exclusive receipt of STAR at 853 or 20.4 percent sites. A total of 239 sites, or 5.7 percent are recipients of all four services. Of all four services, the least exclusive distribution is that for NSA which is received uniquely at 334 or 7.99 percent of the 4,179 recipient sites.

Table 10  
Sites and Combinations of Services Received

	No. of Sites	Percent
USGRDR	1,067	25.53
STAR	853	20.41
TAB	529	12.66
TAB, STAR	362	8.66
NSA	334	7.99
NSA, STAR, TAB, USGRDR	239	5.72
STAR, TAB, USGRDR	160	3.83
NSA, USGRDR	125	2.99
STAR, USGRDR	114	2.73
NSA, STAR, TAB	113	2.70
NSA, STAR, USGRDR	85	2.03
TAB, USGRDR	77	1.84
NSA, STAR	66	1.57
TAB, NSA	29	.69
TAB, NSA, USGRDR	26	.62
Total	4,179	100

Extrapolating from the above data and disregarding exclusive combinations of services, NSA, STAR, TAB and USGRDR are dis-

#### U. S. Diffusion Pattern

distributed among the 4,179 sites as indicated in Table 11. Thus, close to half of all recipient sites (1,992 or 47.67 percent, and 1,893 or 45.30 percent respectively) receive STAR and USGRDR. TAB is received by 1,535 sites, or 36.73 percent, and NSA by 1,017 or 24.34 percent of all recipient sites. From the point of view of site dissemination, STAR is the most widely disseminated service, followed closely by USGRDR. The most widely disseminated combination of services is STAR and TAB which is received by 20.91 percent of all recipient sites.

Table 11  
Distribution of Services, by Site

Service	No. of Sites	Percent of Total Sites (a)
NSA	1,017	24.34
STAR	1,992	47.67
TAB	1,535	36.73
USGRDR	1,893	45.30

NSA, STAR, TAB, USGRDR	239	5.72

(a) Percent based on total of 4,179 sites.

#### Attention Line Distribution

Excluding the approximately 180 private and unaffiliated recipient addresses known, of course, to be addressed to specific individuals, the question posed by the investigator was: who are the initial recipients of the abstracting and indexing services within the industrial organizations and institutions to which they are mailed?

An analysis of organizational and institutional recipients (Table 12) reveals that 43.3 percent of the recipient addresses were designated for the attention of the library, 39.3 percent for the attention

U. S. Diffusion Pattern  
of specific individuals, 14.8 percent had no attention line, 1.3 percent were for the attention of information centers and 1.4 percent for the attention of the security officer. It is, of course, quite

Table 12

Excludes 183 private/official recipients.

possible that services addressed to the security officer or specific individuals may have been forwarded directly to the library. Thus it can be assumed that libraries are the initial recipients of at least half of the abstracting and indexing services mailed to industrial or institutional recipients.

#### U. S. Diffusion Pattern

Of the four services, NSA with 59.4 percent has the highest library attention line designation, followed by USGRDR with 48.3 percent, STAR with 38.0 percent and TAB with 34.9 percent. More than half of the STAR and less than one quarter of the NASA distribution is addressed to individuals outside libraries or information centers.

No distinctive trend emerges when the attention line designations are recorded in terms of COSATI subject fields (Table 26A, Appendix A). Understandably, categories embracing more than one discipline, such as Technology (26), General (27), contain the greatest percentages of recipients with the library attention designation. The greatest number of information center designations are for the fields of Space technology; Materials; Navigation, communications, detection, and countermeasures; Electronics and electrical engineering; Missile technology; and Nuclear science and technology. Within the fields of Mechanical, civil, industrial and marine engineering; Electronics and electrical engineering; Materials, Biological and medical sciences; Aeronautics, are found, in the order stated, the greatest numbers of recipients obtaining directly individually addressed copies of NSA, STAR, TAB, or USGRDR.

#### STAR Domestic Subscribers

Data for STAR domestic subscribers were not released by NASA. For this reason, the partial data that were made available by the U. S. Government Printing Office had to be treated separately. The overall total of 125 domestic subscribers, representing the entire U. S. STAR subscriber population, was subtracted from the total of 8,074 non-Federal U. S. recipients and is presented in Table 27A, Appendix A.

A comparison of data from Table 27A, Appendix A with analogous compilations for the other services (Tables 12 and 15, Appendix A) reveals that the geographic and institutional distribution patterns for STAR subscribers conform closely to the pattern established for the other services. New York, California, New Jersey, Massachusetts, Pennsylvania, Ohio, in the order stated, rank (as they did for all other services) as major recipients for the relatively small number of STAR subscribers. The exclusion of less than one percent of the

U. S. Diffusion Pattern  
Non-Federal U. S. Recipient population and 5.7 percent of the STAR recipient population is believed to be statistically insignificant.

#### Federal Recipients

U. S. Federal Government recipients have been treated in two segments comprising Federal agency recipients other than military, and military recipients. Table 28A, Appendix A provides data on the number of recipients by service, and specific agency. Although STAR is the most widely distributed abstracting and indexing service, more than half of its recipients are within the National Aeronautics and Space Administration. Table 29A, Appendix A provides copy distribution data for NSA, TAB, and USGRDR. It should be noted that about 100 copies of NSA, and a somewhat smaller number of TAB and USGRDR are distributed internally to the respective staffs of the Atomic Energy Commission, Department of Defense, and Department of Commerce. This informal distribution is not reflected in the statistics represented in Table 29A.

Compiled in Tables 30A-31A, Appendix A is the military recipient distribution in terms of service received, number of copies distributed, subdivided by state. As might have been expected, TAB is by far the most heavily distributed abstracting and indexing service. It is received by 70.36 percent of the military population, followed by STAR, received by 15.28 percent, NSA by 8.19 percent and USGRDR by 6.16 percent. The concentration of recipients in the District of Columbia, Ohio (site for Wright Air Development Center), Virginia, and Maryland is indicative of military R & D activity within these states. The sizable recipient figures for California and New York should be discounted to some degree since they reflect distribution destined for U. S. overseas military installations.

#### GPO Depository Library Recipients

As a group, GPO depository libraries represent both Federal and non-Federal organizations which have a number of common characteristics. Invariably, such libraries are housed within educational and nonprofit institutions. By statute the resources of these libraries are made accessible to the general public. The libraries have the right to select and acquire without cost from the Superintendent of Documents items designated for depositories which may be

#### U. S. Diffusion Pattern

of interest to their respective clientele. While the three abstracting and indexing services of NSA, STAR, and USGRDR are listed as depository items and available for distribution, 28 percent of the 854 GPO depositories chose to select none of the abstracting and indexing services (see Table 32A, Appendix A). One possible reason for non-selection may be due to the fact that a number of state and municipal law libraries, and small college and public libraries have been designated as GPO depositories. Frequently there is little demand for science and technology-oriented abstracting and indexing services within their particular institutional environments.

Of the 616 GPO depositories that did elect to receive one or more of the services, 81.5 percent selected NSA, 74.5 percent USGRDR, and 64.6 percent selected STAR. A breakdown of specific services received, arranged by state, is provided in Table 33A, Appendix A.

#### Foreign Recipients

Out of the entire universe of 15,656 recipients for all four abstracting and indexing services, the foreign population comprises 3,401 addresses, or 21.7 percent. The percentage of foreign recipients would have been 27.9 percent were it calculated on the basis on those services which are not subject to export restrictions. Department of Defense regulations place TAB under special export controls. While transmittal of TAB to certain foreign nations has been made under existing information exchange agreements, the number of recipients under such agreements has been quite small.

In considering foreign as well as domestic distribution of abstracting and indexing services, one must not lose sight of the fact that well-organized national or regional documentation center networks, even when receiving a single copy of any one service, through reproduction and allied selective dissemination systems, can attain wide diffusion of information.

Unlike the foreign distribution pattern for Referativnyi Zhurnal, the major recipients of NSA, STAR, and USGRDR are the research-oriented, heavily industrialized nations. The United Kingdom has 17.5 percent of the foreign recipient population, Japan 10.3

#### U. S. Diffusion Pattern

percent, France 9.7 percent, Germany (East and West) 9.4 percent and Canada 7.0 percent (see Table 34A, Appendix A). A clear inference that can be drawn from these data is that the foreign country distribution pattern for NSA, STAR and USGRDR bears a positive relationship to the per capita and gross national product devoted by the respective countries to research and development.

When the distribution pattern is examined in terms of the individual services, we find that 46.73 percent of the foreign recipient group receives NSA, 27.40 percent STAR, and 26.23 percent USGRDR. The popularity of NSA is also evident when one notes the distribution pattern based on paid subscriptions. About half or 51.71 percent of all foreign subscribers obtain NSA, 8.77 percent obtain STAR, and 39.52 percent acquire USGRDR. The U. S. Atomic Energy Commission established a total of 78 depository libraries in foreign countries. These libraries have been placed on standard distribution to receive most of the technical report literature abstracted and indexed in NSA. The knowledge that the technical report literature is accessible may have been a contributing factor to the relatively high demand for Nuclear Science Abstracts.

#### Summary

The Federal government recognized the need for abstracting, indexing and disseminating the technical report literature stemming from publicly-financed research. An average of 250 million dollars has been allocated annually by Federal government agencies for scientific and technical information needs. Of this total, approximately 30 percent was earmarked for publication and distribution tasks. On the basis of data collected in the course of this study, an effort was made to determine the extent of distribution and pattern of diffusion for the federally-produced abstracting and indexing services of NSA, STAR, TAB, and USGRDR. Information derived from nine official mailing lists and subscriber and exchange mailing lists for each of the services was coded and permuted with the aid of data processing equipment. While of immediate concern was the analysis of data relating to the non-Federal U. S. recipient sector, all recipient information, including that for Federal recipients, GPO Depository Library

#### U. S. Diffusion Pattern

recipients as well as foreign recipients was quantified and tabulated. Some of the more significant findings are the following:

##### Total Recipients

Total recipients for all four services comprised 15,656 addresses of which eighty percent represented domestic recipients and twenty percent foreign recipients.

##### Domestic Recipients

Of 12,226 domestic recipients, twenty-three percent were in the Federal government (including the Military), 12 percent were GPO Depository Library recipients, and 66 percent were non-Federal U. S. recipients.

##### Non-Federal U. S. Recipients

Analysis of 7,949 non-Federal U. S. recipient file addresses revealed that the addresses represented recipients affiliated with 3,004 discrete organizations or institutions occupying a total of 4,179 sites or geographic locations.

Two-thirds of all non-Federal U. S. recipients were affiliated with industrial organizations, and thirty percent with educational and nonprofit institutions.

Seventy-two percent of all non-Federal U. S. recipient establishments were from the industrial sector, and twenty-three percent from the educational and nonprofit sector.

Each of the services of NSA, STAR, TAB, and USGRDR was received to a varying degree, by recipients in each of the twenty-seven COSATI subject fields, thus indicating an overall recipient population covering the entire spectrum of science and technology.

Without implying a cause and effect relationship, a definite correlation was found to exist between subject field areas in the forefront of R & D investment and top ranking COSATI subject field recipients.

Within the industrial sector, the COSATI subject field, Electronics and electrical engineering contained the largest number of recipients (18.8 percent).

Within the educational and nonprofit sector, the COSATI subject field Biological and medical sciences contained the largest

#### U. S. Diffusion Pattern

number of recipients (15.2 percent).

Without implying a cause and effect relationship, a definite correlation was found to exist between industry segments in the forefront of R & D investment and economic expansion and top ranking Standard Industrial Classification (S.I.C.) recipient categories.

Classed in accordance with S.I.C. categories, the 2,154 industrial recipient establishments had the largest recipient group of twenty-seven percent, representing for the most part industrial organization whose primary activity was research and development rather than manufacturing.

Top ranking for manufacturing establishments, in the order stated, are establishments classed in the S.I.C. categories of Electrical equipment and communication, Chemical and allied products, Machinery, Professional and scientific instruments, and Aircraft and missiles.

Without implying a cause and effect relationship, a definite correlation has been found to exist between regional and state distribution of such economy input variables as total R & D funds, industrial R & D funds, scientists and engineers employed, number of manufacturing establishments, doctorates employed, and the regional or state distribution of recipients of the abstracting and indexing services.

Five U. S. states accounted for nearly half of all non-Federal U. S. recipients; seventeen states each contained less than one-half of one percent of the recipient population; thirteen additional states each contained less than one percent of the recipient population.

Regions and states having a high industrial recipient population also had a high educational recipient population.

The Middle Atlantic, Pacific and East North Central regions, in the order stated, are the top-ranking recipient regions for the abstracting and indexing services.

Geographic distribution of recipients for the specific services of NSA, STAR, TAB, and USGRDR generally conformed to the pattern established for all four services.

An average of 2.15 copies of one or more abstracting and

#### U. S. Diffusion Pattern

indexing services was sent to each recipient address.

Geographic distribution of copies generally conformed to the pattern established for geographic distribution of recipients.

The bulk of multiple copies recipients was confined to those services available gratis recipients having an official connection with Federal government agencies.

Ninety-seven percent of USGRDR recipients subscribed to a single copy only of that service. The inference can thus be made that unless formal provision is made for wider internal dissemination, receipt of a single copy of any one abstracting and indexing service would preclude its extensive use as a current awareness medium.

Of 4,179 sites or geographic locations receiving the abstracting and indexing services, forty-eight percent received STAR, forty-five percent received USGRDR, thirty-seven percent received TAB, and twenty-four percent received NSA.

The most widely disseminated combination of services was for TAB and STAR, received by twenty-one percent of the recipient sites.

A total of 239 sites, or six percent of the 4,179 sites, received all four services; 437 sites, or ten percent, received the combination of NSA, STAR, and USGRDR or TAB.

Close to half of the abstracting and indexing services were specifically addressed to the attention of the library or information center.

#### GPO Depository Library Recipients

Twenty-eight percent of 854 GPO Depositories received none of the abstracting and indexing services.

Of 616 recipient GPO Depository Libraries, eighty-one percent received NSA, seventy-five percent USGRDR, and sixty-five percent received STAR.

#### Federal Recipients (Military)

Of the total 1,852 Federal military abstracting and indexing service recipients, seventy percent received TAB, fifty percent received STAR, eight percent received NSA, and six percent received

USGRDR.

Foreign Recipients

Without implying a cause and effect relationship, a definite correlation has been found to exist between R & D investment and degree of industrialization in foreign countries and the concentration of recipients of the abstracting and indexing services within these countries.

In sharp contrast to the dissemination pattern for Referativnyi Zhurnal whose foreign recipients were to be found overwhelmingly in Communist countries, i. e., without regard to degree of national industrialization, foreign recipients of the federally-produced abstracting and indexing services were sent to the research-oriented, industrialized nations.

Print. Off., 1965, p. 608.

11. Source: U. S. Congress. House. Select Committee on Government Research. Statistical Review of Research and Development. Report, 88th Cong., 2nd Sess. (Study No. LX; House Report No. 1940). Washington, D. C., U. S. Govt. Print. Off., 1964, p. 201.

12. Approximately 9,000 copies of STAR have been printed in 1965-66 for both foreign and domestic use. (Source: Smuter, Hubert E. Private Communication, July 26, 1965). Of this total, only about 130 copies were sold by the Government Printing Office to U. S. subscribers. The number of non-Federal U. S. official STAR recipients was 2,718 (See Table 6). Excluding the Federal, GPO Depository Library and foreign recipient distribution, it is estimated that an average of about two copies of STAR are sent on NASA official distribution to NASA recipients.

## Chapter 5

### Recipient Population Characteristics and Use Made of NSA, STAR, TAB, and USGRDR

While quantitative data for recipients of the abstracting and indexing services of NSA, STAR, TAB, and USGRDR were readily available from the analyses of the recipient file addresses, qualitative data relating to recipient creativity or educational background, company or institutional research environment, degree and type of use made of the abstracting and indexing services, were totally lacking. No data at all were available on research-oriented firms and institutions that were nonrecipients of any of the services. The questionnaire method, supplemented by selective interviews and detailed analyses of a number of industrial and institutional directories, provided information to assess, in some depth, recipient and nonrecipient characteristics as well as the actual use made of the abstracting and indexing services. A "Recipient Questionnaire" (Appendix C) and a "Nonrecipient Questionnaire" (Appendix D) were designed and pre-tested on more than 50 scientists, engineers, and librarians. After incorporating comments and suggestions, including those from members of the Columbia University faculty and an industry survey consultant, the questionnaires were mailed to selected samples of recipients and nonrecipients of the four abstracting and indexing services under study.

The Recipient Questionnaire was sent to a stratified random sample of 1,153. The sample represents 15 percent of the entire population in the Non-Federal U. S. Recipient File. The Recipient Questionnaire was also mailed to a 15 percent random sample (91 recipients) selected from the 316 GPO Depository Library File. The Nonrecipient Questionnaire, a shorter and revised version of the Recipient Questionnaire, was sent to a random sample of supposed research-oriented nonrecipients of any of the services. Analysis of the nonrecipient population, including results of the Nonrecipient Questionnaire, is provided in Chapter 6.

### Recipient Population Sampling Technique

Since major characteristics of the recipient population had been coded and were available on tape, a sample was sought which would take into account such factors as institutional or organizational types, concentration of recipients within certain geographic regions, and each of the abstracting and indexing services under study.

A permutation of the major recipient types (Industrial Organizations; Educational and Nonprofit Institutions; Private and Unaffiliated Recipients; State and Local Government Agencies), geographic locations (50 U. S. states and the District of Columbia), and the four abstracting and indexing services yields a theoretical possibility of 816 combinations, assuming that each combination or permutation is represented in the recipient file. As determined after a computer run of the 7,949 non-Federal U. S. recipients, a total of 449 combinations was actually present.

The 449 combinations or permutations were grouped by the computer, and the accession numbers of the recipient members counted and stored in its memory. From each permutation of recipients, a 15 percent sample was sought. In some instances the number of recipients selected from a given permutation resulted in a number containing a fraction. When that was the case, the change of the fraction to an integer was determined through the use of the following procedure: a random number between 0 and 1 was supplied by a computer subroutine. The random number was compared to the fractional part of the selected number. If the random number was larger than the fractional part of the number, the nearest smaller integer was used. If it was smaller, the nearest larger integer was used.

The selection of recipients from a given permutation was performed as follows: a random number between 0 and 1 was multiplied by the total number of recipients grouped within a permutation. The nearest permutation group member whose number was greater than the random number was selected as part of the sample. The selected member or recipient was then removed from the permuted group of recipients, and another random number was used to select the next recipient. If needed, this process was repeated until the predetermined

### Recipient Population

number of recipients, approaching 15 percent of the permuted population, had been selected.

A printout of the selected recipient accession numbers was obtained in numerical sequence. A set of punched cards containing all data previously coded for these recipients was also obtained. Since the questionnaires were assigned the accession numbers of the selected recipients, these cards served as a control file for completed questionnaires and were eventually used for a comparative analysis of the portion of the questionnaire sample returned, and the entire Non-Federal U. S. Recipient File population from which the sample was drawn.

### Recipient Questionnaire Mailings

In August 1966, the Recipient Questionnaire and cover letter (Appendix C) was mailed to each of the 1,153 individuals, institutions, and industrial firms comprising the sample derived from the Non-Federal U. S. Recipient File. Mailed also were the 91 Recipient Questionnaires representing a 15 percent random sample selected from the GPO Depository Library File. A single follow-up letter (Appendix C, no. 3) was sent to nonrespondents one month from the date of the initial mailing of the questionnaire.

While addressed exactly as indicated on the mailing label found in the Non-Federal U. S. Recipient File, instructions for the Recipient Questionnaire called for completion by the "primary user" of only those services circled in red on the first page of the questionnaire. When addressed to and used by a library or information center, the librarian or information specialist "most knowledgeable about the use made of the services," was requested to complete the questionnaire.

### Recipient Questionnaire Responses

Since the Recipient Questionnaire was rather formidable--12 pages and 50 questions--a minimal response was anticipated. The response, however, was adequate to assure valid results. For the 1,139 questionnaires mailed (14 questionnaires were undeliverable), a total of 823 or 72.3 percent responses were received. Many included extensive comments. Of the total non-Federal U. S. respondents,

### Recipient Population

776 or 68.1 percent returned usable questionnaires. For the GPO Depository Library recipient mailing, 67 responses were received (73.6 percent) including 60 usable questionnaire returns comprising 65.9 percent of the questionnaire sample mailing.

### Representativeness of Recipient Questionnaire Returns

How representative were the returns in relation to the population bases from which the questionnaire samples were drawn? Table 13 provides a breakdown for the 776 non-Federal U. S. respondents by abstracting and indexing service as well as recipient type. A comparison of data in Table 13 with analogous data for the entire Non-Federal U. S. Recipient File (Table 6) discloses that the four abstracting and indexing services as well as the four types of institutions receiving them are fully represented in the returns. Whereas industrial recipients represent 66.5 percent, educational and nonprofit recipients 30.4 percent, private or unaffiliated recipients 2.3 percent, and state and local government agencies 0.7 percent of all non-Federal U. S. recipients, for the 776 Recipient Questionnaire returns industrial recipients represent 65.9 percent of responses, educational and nonprofit recipients 32.0 percent, private or unaffiliated recipients 1.8 percent, and state and local government recipients 0.4 percent. In terms of specific services, the Non-Federal U. S. Recipient File comprises 15.9 percent of NSA recipients, 34.2 percent of STAR recipients, 23.5 percent of TAB recipients, and 26.4 percent of USGRDR recipients. The questionnaire responses represent replies for 16.5 percent NSA, 36.9 percent STAR, 25.3 percent TAB, and 21.4 percent USGRDR recipients.

Table 36A, Appendix A provides a geographic breakdown by 50 U. S. states and the District of Columbia for the 776 non-Federal U. S. respondents. When data in Table 36A, Appendix A, are compared with similar data in Table 12A, Appendix A, indicating the geographic distribution pattern for all non-Federal U. S. recipients, the representativeness of the questionnaire returns with respect to the 51 geographic distribution variables is also amply demonstrated.

GPO Depository Libraries are a relatively homogeneous group and have been established historically on the basis of geographic

Table 13

### Recipient Population

representation rather than specific need. As may be surmised from Table 32A, Appendix A, many of these libraries receive all three of the distributable services of NSA, STAR, and USGRDR. A return of 65.9 percent of the random sample, accounting for 9.7 percent of the entire GPO Depository Library population, can therefore be considered sufficient to represent this segment of recipients.

### Recipient Questionnaire Analysis

#### Individual Recipient Characteristics

Of all non-Federal U. S. respondents returning completed questionnaires, nearly half were completed by librarians or analogous information services personnel. A total of 36.9 percent of the librarian respondents were from industrial establishments, while 13.0 percent were from educational and nonprofit institutions. Not unexpectedly, the questionnaires returned by GPO Depository Libraries were nearly all completed by librarians (Table 14).

Table 14

#### Recipient Questionnaire Respondents, by Broad Institutional Groupings

	Non-Fed. U. S.		GPO Dep. Library	
	Respondents	Percent	Respondents	Percent
Librarians (Industry)	286	36.9	-	-
Individuals (Industry)	240	30.9	-	-
Librarians (Education- al/Nonprofit Institutions)	101	13.0	56	93.3
Individuals (Educational/ Nonprofit Institutions)	149	19.2	4	6.6
Totals	776	100	60	99.9

### Primary Activities of Respondents

What were the primary activities of the majority of industrial and institutional respondents whose official titles did not indicate library or information service affiliation? About one-fifth of all non-Federal U. S. respondents indicated Management and Administration as their primary activity. A total of 8.9 percent was engaged in

#### Recipient Population

teaching at the college or university level. Excepting librarianship, the largest group (21.5 percent) was engaged primarily in research and development activity (Table 13). Of course, it must be realized that the checking of a primary activity<sup>1</sup> other than research and development does not necessarily imply that the respondent was not participating to a more limited extent in research and development work. When all respondents were asked to reply whether they were personally engaged in carrying out current research and development, a total of 48.3 percent answered positively to this question (Table 16). When the percentages of respondents carrying out research and development activity was calculated on the basis of non-librarian responses, a total of 69.2 percent of individuals in industry and 85.2 percent of individuals in educational and nonprofit institutions indicated that they personally carried out research and development work. Thus, an average of 77.0 percent of non-librarian respondents was engaged to some extent in research and development. Many librarians, particularly those employed in special libraries, while answering in the negative, commented that although not "personally" engaged in research, a great deal of their time was devoted in direct support of R & D projects. Of the close to 360 respondents who did engage in research and development, over half spent 50 or more percent of their total staff time in this activity (Table 17).

To what extent was research and development carried out for Federal government agencies? A comparison of data in Table 18 and those presented in Table 16 reveals that while 360 respondents stated that they performed research and development, a total of 263 or about 73 percent of that total also stated that they performed R & D for Federal government agencies. It thus seems obvious that of those who engaged in R & D work, approximately three quarters were to some extent performing R & D for Federal government agencies. The Department of Defense, the National Aeronautics and Space Administration, and the Atomic Energy Commission, in the order given, were the most frequently cited Federal government contracting agencies (Table 18). A majority of 88.6 percent of GPO Depository Library respondents, compared to 46.7 percent of non-Federal U. S. respondents,

did not engage in R & D work for Federal agencies. This, of course, is a reflection of the relatively smaller percentage of educational and nonprofit personnel engaged in R & D, as compared to industrial personnel.

Subject Specialization of Respondents

### **Recipient Population**

Librarianship as a subject specialty rather than prime activity was common to 30.2 percent of non-Federal U. S. respondents and to 80 percent of GPO Depository Library respondents. Apparently many individuals in the non-Federal U. S. recipient sector, while concerned primarily with the operation of libraries, have had other than library school training. Additional high ranking subject field specialties, in the order stated, were Electronics and electrical engineering (10.8 percent of respondents), Chemistry and chemical engineering (10.5 percent), Mechanical, industrial, civil and marine engineering (8.6 percent), Materials and metallurgy (7.2 percent), Aeronautics (6.3 percent), and Physics (5.3 percent). Behavioral and social sciences (including Humanities) constituted the major specialty for only 1.8 percent of non-Federal U. S. respondents and 9.1 percent for GPO Depository Library respondents (Table 19). Excluding librarianship, the subject specialties of the Recipient Questionnaire respondents, though not factorized into the sampling procedure, paralleled closely the subject fields determined to represent the entire non-Federal U. S. recipient population of the abstracting and indexing services (See Table 7).

### **Scope of Respondent Information Needs**

In practicing their particular specialties, did the respondents have a need within the last twelve months to undertake a line of research that was definitely outside their field of specialization? Of the 605 non-Federal U. S. respondents to this question, a total of 42.1 percent indicated that they did have such a need (Table 20). An even greater percentage (61.0 percent) indicated a need within the last twelve months for "data, techniques, processes, equipment," from outside the field of their specialization (Table 21). The broad spectrum of information needs may have contributed in part to the reluctance of respondents to maintain a personal file of citations pertinent to their subject specialty. Less than half of the non-Federal U. S. respondents maintained such a file (Table 22).

### **Educational Background**

As a group, the respondents were highly educated. Nearly all had undergraduate or higher degrees, while approximately one fourth

held doctoral degrees (Table 23). The greatest number of respondents (39.6 percent) received degrees during the period of 1950-1959 and a total of 24.2 percent graduated in 1960 or later (Table 24). Thus it can be concluded that a preponderance of respondents falls within the 30-40 year age group.

of the abstracting and indexing services contributors to the professional literature? A total of 40.1 percent of non-Federal U. S. respondents, compared to 3.8 percent of GPO Depository Library respondents, had been authors, coauthors, or editors of technical reports within a specified twelve month period (Table 25). More than a fourth of the non-Federal U. S. respondents (26.2 percent) and 7.8 percent of GPO Depository Library respondents had been authors, coauthors, or editors of professional papers published in the journal literature within that same period (Table 26). A total of 10.6 percent of all non-Federal U. S. respondents compared to zero percent for GPO Depository Library respondents had submitted patent applications within the last twelve months (Table 27).

While writing or editing technical reports and papers and submission of patent applications may not necessarily be wholly reliable

### Recipient Population

Indicators of individual or corporate creativity or innovation, their overall statistical evaluation can, in conjunction with other factors, be helpful in characterizing a respondent group or organization.

Fifty percent of the non-Federal U. S. respondent group were librarians whose tasks generally do not entail direct research or publication of research results. The percentage of respondents writing and editing technical reports and professional papers, and the percentages of those with patent applications would probably have been considerably higher if they were calculated solely on the basis of non-librarian responses. The data from the GPO Depository Library respondents support this conclusion. Cross-tabulation of the variable "writing and editing technical reports" revealed that of 459 negative responses, 72 percent were from librarians.

### Recipient Organization Environment

Most of the respondents were employed in companies and institutions with staffs of many hundreds of scientists and engineers.

### Recipient Population

More than a third of the organizations with which the respondents were associated employed 500 or more scientists and engineers exclusive of managerial and supporting personnel. Two thirds of all companies and institutions employed 100 or more scientists and engineers. It is evident that the larger companies were predominant in the Recipient Questionnaire responses (Table 28). On the other hand, data derived from the Nonrecipient Questionnaire (See Table 66) indicated that the smaller companies were predominant. At what point in the industrial growth cycle did the large companies begin to acquire the abstracting and indexing services? Is there a clear cause and effect correlation between size of company and receipt of these services? One can only speculate as to the probable answers. The only conclusion that can be safely drawn is that a relationship exists between the size of the scientific and technical staff of an organization and the receipt or nonreceipt of the abstracting and indexing services within that organization.

## **Recipient Population**

### **Recipient Organization R & D Performance**

While only about half of all non-Federal U. S. respondents and 77.0 percent non-librarian respondents indicated that they were personally engaged in research and development activity (Table 18), a total of 87.7 percent stated that their companies and institutions conducted in-house or internally sponsored research (Table 29). About half of the employers were conducting research and development for other private organizations and institutions (Table 30).

recipient organizations. They were also contributors to the technical report literature. When asked the more restrictive question as to whether company or institution scientists and engineers, other than the respondent, published professional papers in the journal literature within the most recent twelve month period, 89.2 percent of respondents answered affirmatively (Table 32). 81 percent of the respondents stated that other scientists and engineers employed with the host organizations had submitted patent applications within the last twelve months (Table 33).

### Use of Abstracting and Indexing Services

When asked whether the respondent had, within the last six months, made any use of these abstracting and indexing services, 91 percent of non-Federal U. S. respondents answered affirmatively. Of the small group of 69 non-Federal U. S. recipient nonusers of the services within the preceeding six month period, 33 were individuals from industry, 14 were librarians in industrial establishments, 17 were individuals in educational and nonprofit institutions, and 5 were librarians in educational and nonprofit institutions. Of the 55 GPO

#### Recipient Population

Depository Library respondents, only about half personally used the services (Table 34). Some negative responses mostly from GPO Depository and university librarians were qualified with statements indicating that although not personally used by the librarian, the services were used by the public, but to an unknown degree. A typical qualifying statement is the following made by a university librarian:

We receive the publications listed. They are added to our general catalogued collection and are available to any student or faculty member as any other item on our library shelves. We have no means of obtaining user information.

Table 34  
Recipient Questionnaire Respondents, Use of

Total	766	100	55	100

Of 625 non-Federal U. S. respondents who had personally devoted a certain amount of time to the scanning of issues of the abstracting and indexing services as soon as they were received, 31 percent spent 5-14 minutes, while 14.0 percent spent less than five minutes in scanning the issues (Table 35). Thus, for any one of the semi-monthly, federally produced abstracting and indexing services, approximately three quarters of the non-Federal U. S. recipients devoted less than one half hour each to scanning the newly received service. Apparently, the current awareness function which has proven to be the primary function of the abstracting and indexing services, can be fulfilled by the services without excessive demands on the recipient's time.

Factors such as growing output and the dispersal of relevant abstracts among several disciplines have been cited in the past as reasons for not scanning such services as Chemical Abstracts.<sup>2</sup> The provision of detailed indexes, including subject, personal author,

#### Recipient Population

corporate author, and report number indexes which have been made available with each issue of NSA, STAR, TAB and, more recently, for USGRDR, and the grouping of abstracts within a number of clearly defined subject fields, have substantially overcome the objections to scanning.

With what frequency have the specific abstracting and indexing services of NSA, STAR, TAB, and USGRDR been used for retrospective information searches? How does this frequency of use compare with the use made of other privately published abstracting and indexing services? Bearing in mind that responses were elicited from known recipients of the federally-produced abstracting and indexing services, those receiving the greatest daily use for retrospective searching were, in the order stated, Technical Abstract Bulletin, Scientific and Technical Aerospace Reports, Chemical Abstracts, Engineering Index, Nuclear Science Abstracts, and U. S. Government Research & Development Reports (Table 36).

Rather sharp differences in the daily use made of USGRDR as compared to the other services are apparent and can in all probability be explained by the unavailability of USGRDR cumulative indexes. The announcement by the Clearinghouse for Federal Scientific and Technical Information that beginning July 1966, the Government-Wide Index to Federal Research & Development Reports (GWI) would be published on a semi-monthly basis and should thus better serve as an index to USGRDR may alleviate, but certainly will not solve the indexing problem for that service. A university librarian comments:

My principal objection to USGRDR-GWI now is the lack of cumulated indexes. I believe the only cumulation done since 1963 is the one covering January-March 1965. I now hear that no full-size copy cumulated indexes for USGRDR or GWI are to be published in the future. . . If this information is correct, the value of this abstracting service must decrease over the years because searches will prove too time-consuming for most reference purposes. (For those of us who have access to TAB, we can use it for locating information about DOD reports. Its cumulated indexes have been coming out quite promptly. However, TAB is restricted. We are

...to restrict its use to the  
library staff and to certain members of the academic  
staff working on DDD contracts. We cannot allow most  
library users to see it. I suppose most libraries of a  
public nature have the same problem.

#### Reasons for Using Abstracting and Indexing Services

What are some of the most frequent reasons given by non-Federal U. S. respondents for using the abstracting and indexing services? In rank order these are: scanning for specific information directly pertinent to current work (27.9 percent of respondents), keeping abreast of current literature in primary field of interest (24.3 percent), quick retrospective reference or information retrieval (17.3 percent) (Table 37).

When asked to rank reasons for use in descending order of importance, the current awareness function rather than retrospective retrieval was predominant for almost all place rankings. The highest percentage of respondents (57.1 percent) ranked first the use made in acquiring "specific information directly pertinent to... current project or research" (Table 38), (42.2 percent) selected "keeping abreast of current literature in primary field of interest," while (45.3 percent) chose "keeping abreast of current literature in secondary fields of interest."

Table 39 represents responses for the most recent use made of the abstracting and indexing services by non-Federal and GPO Depository Library recipients. The use by almost half of the non-Federal U. S. respondents (46.0 percent) for the purpose of "keeping abreast of newly published literature" lends further support for the "current awareness" function as being the primary function of the abstracting and indexing services.

#### Types of Information Sought

What types of information or data were most frequently sought by recipients of the abstracting and indexing services? When using these services, was the information generally looked for within the specific section covering the respondents own, subject field, or was it also sought in other sections covering related fields?

Table 37

### Recipient Population

Close to half of the non-Federal U. S. respondents did not confine their search for information to their own primary field. The proportion holds constant for almost all types of information listed, with the exception of Reviews, State-of-the-Art Surveys which were sought more extensively in more than one field (Table 40). It is, of course, expected that a greater percentage of respondents would be searching outside their own field for this type of information.

Table 41 discloses that abstracting and indexing services were utilized most frequently by non-Federal U. S. respondents in locating specific data or findings. The category, "Reviews, State-of-the-Art Surveys," ranked second.

### User's Approach to Abstracting and Indexing Services

Some users refer only to the Table of Contents when using some of the abstracting and indexing services, others make direct use of the indexes or examine specific sections, while others still may browse through the issue or use a combination of approaches.

Tables 42 and 43 depict the various approaches that are employed by the user when seeking information in abstracting and indexing services. Of 856 non-Federal U. S. respondents, 57.5 percent make direct use of the indexes. As might have been expected, 85.7 percent of GPO Depository Library respondents made direct use of the indexes (Table 42). Since more than one approach could be utilized, the respondent was asked to check all approaches listed.

The unique or combination of approaches is disclosed in Table 43. Unique use of indexes has been found to represent 20.1 percent of respondent approaches, while the unique use of the Table of Contents for checking both the primary and secondary fields of interest, represents 16.0 percent of respondent approaches. The most frequently used combination (10.9 percent of respondents) was use of indexes and the use of the Table of Contents, with the latter used for checking the primary and secondary fields of interest.

### Index Usefulness and Frequency of Use

While data from Table 42 and Table 43 disclose the relative percentage of users making direct use of indexes when using abstracting and indexing services, there is no indication of the value attached

by the user to the various types of indexes. Table 44 represents an evaluation of usefulness of the personal author, corporate, subject, report number, and contract number indexes. Table 44 indicates that though all of the indexes have been found to be useful to some extent by at least 50 percent of respondents, the subject index far out-ranks all other indexes. Second ranking in the "very useful" category has been accorded to the report number index, while the least useful index was the contract number index. The latter is rarely used by 48.0 percent of the 592 respondents.

Table 45 provides a tabulation of the use or non-use made of indexes to NSA, STAR, TAB, and USGRDR. It indicates that high utility and value are attributed to the subject index. Not only is the subject index used by most respondents as a direct approach to the contents of the services, but also it ranks above all other indexes in frequency of use for "Daily," "Weekly," as well as "Monthly" use.

## Subject Scope Preferences for Abstracting and Indexing Services

In recent years there has been considerable discussion and

Table 44

(b) Percent based on column sum.

### Recipient Population

speculation regarding the desirability of segmenting comprehensive abstracting and indexing services into narrow specialties. Such segmentation or fractionalization has, of course, been applied to Referativnyi Zhurnal although the complete volumes are still available to those who wish to subscribe to them. A similar trend has also been apparent in Chemical Abstracts and a number of other abstracting and indexing journals.

When the users of the broadly based mission rather than subject-oriented service of NSA, STAR, TAB, and USGRDR were asked whether, in lieu of present scope, they preferred several other suggested approaches, 63.9 percent preferred the present format (Table 46). Only 4.0 percent preferred to receive abstracts exclusively within their own primary field. A total of 23.1 percent preferred abstracts covering the broad primary field encompassing the respondent's subject specialty.

Comprehensiveness is considered to be an advantage to the librarian conducting a literature search. When abstracting and indexing service preference responses were tabulated on the basis of non-librarian replies, though undergoing some changes, the percentages for the respective responses remained fairly constant. Forty-seven percent of non-library respondents preferred the present format without any change, 6.3 percent were interested in abstracts devoted exclusively to their own subject specialty, and 32.8 percent desired broad primary and secondary subject field coverage.

### Recipient Organization Library and Information Services

The vast majority of recipient companies and institutions (96.4 percent) maintained libraries or information centers (Table 47) which were readily accessible to the respondents (Table 48). Asked whether the library or information center was staffed by a professional librarian or information specialist, 70.3 percent answered affirmatively (Table 49). In a number of instances, the responses were qualified with explanatory notes to the effect that the individual responsible for the library, although a professionally trained person, was not necessarily trained as a librarian.

A large majority of respondents (82.3 percent) found it "rather easy" to acquire publications cited in the abstracting and indexing services (Table 50). However, a considerable number of comments were made regarding difficulties inherent in obtaining technical reports having a "limited" distribution designation. Problems relating to the maintenance of an active field-of-interest register with the respective agency documentation centers have also been singled out as deterrents to the acquisition of needed reports.

## Recipient Population

Table 50

Total	613	100	25	100

More than half of the non-Federal U. S. respondents retained copies of the respective abstracting and indexing services for a period of three or more years (Table 51). This is an indirect measure of the value attached to these services. The proportion of library recipients retaining copies of the services would, of course, be considerably greater.

As recipients of at least one of the services, the respondents were asked whether they would be interested in obtaining information about any of the other services which they did not currently receive. A total of 259 non-Federal U. S. respondents, or 33.4 percent, and 27 GPO Depository Library respondents, or 45.1 percent, indicated such an interest (Table 52).

### Library Facilities, Policies and Procedures

Recipient population library and information center personnel were asked to complete a portion of the questionnaire relating to internal library procedures, practices, and resources which could have an effect on the use made of the abstracting and indexing services and on use of the technical report literature in general.

What direct functions did the library carry out to enhance the value of the abstracting and indexing services? Did the availability of these services relieve the library of the task of cataloging technical reports? What secondary measures were undertaken by the library or information center staffs to bring to the attention of their clientele items announced in the services?

Total	259 <sup>(a)</sup>		27 <sup>(a)</sup>	

(a) Percent and totals based on number of respondents.

From data disclosed in Table 53, it becomes evident that 80.2 percent of non-Federal U. S. recipient libraries and information centers, compared to 53.1 percent of GPO Depository Libraries, do catalog technical reports; 73.7 percent of non-Federal libraries, compared to 40.6 percent GPO Depository Libraries issue an acquisition or announcement bulletin; close to two-thirds of non-Federal U. S. respondent libraries and information centers compared to one-eighth of GPO Depository Libraries selectively disseminate newly acquired technical reports. The lower percentage figures for the GPO Depository Libraries are indicative of the lower level of specialized service for the technical report literature prevalent within libraries housed in educational and nonprofit institutions. When the non-Federal U. S. recipient population is broken down into its industrial and educational sectors, cataloging of technical reports is performed by 80.2 percent of industrial libraries compared to 19.8 percent of libraries in the educational sector, selective dissemination of incoming technical reports is carried out by 85.2 percent of the industrial sector compared to 14.8 percent of the educational sector, abstracts are selectively disseminated by 88.5 percent of the industrial sector and 11.5 percent of the educational sector, the issuance of an acquisitions or announcement bulletin is undertaken by 83.5 percent of libraries in the industrial sector compared to 16.5 percent of libraries in the educational sector.

### Recipient Population

Why do 80.2 percent of non-Federal U. S. libraries and information centers find it necessary to catalog technical reports? A large segment of respondents (42.6 percent) indicated a need for more detailed subject analysis than that provided in the services (Table 54). Informal comments were made indicating that a number of respondents thought the card catalog should provide a primary approach to the library's collections and that, consequently, it was essential for the card catalog to reflect the library's holdings. Many libraries cataloged technical reports, but did so selectively in order to bring out subject matter of particular interest to the recipient organization. Maintenance of standardized filing procedures, a capability to ascertain quickly holdings within series, a record of documents to be retained for the permanent collections, use of cataloging data for internal announcement bulletins or computer based systems, are some of the additional reasons given for cataloging technical reports.

Internal Announcement and Distribution

From data in Table 53, it is evident that 73.7 percent of non-Federal U. S. recipient libraries and 40.6 percent of GPO Depository Library recipients issue an internally-produced library acquisitions or announcement bulletin. The bulletin is generally distributed on a monthly basis by approximately half of the reporting libraries (Table 55). What are the library and information center policies relating to routing and dissemination of the abstracting and indexing services of NSA, STAR, TAB, and USGRDR? Data in Table 56 indicate that approximately a third (34.0 percent) of non-Federal U. S. recipient libraries and three quarters (74.1 percent) of GPO Depository Library recipients do not permit routing or circulation of the abstracting and indexing service issues. When the issues were sent to individual departments or sections for retention, an average of 6 individuals made use or had access to the service; when sent via routing, an average of 5.7 names were entered on the routing slip (Table 56).

Table 57 discloses the average number of subject headings, descriptors, uniterms, etc., utilized by libraries in the subject analysis of technical reports. Of 258 out of 384 library respondents, or 67.2 percent library respondents performing subject analysis of

Total	304	99.9	19	100

technical reports, the greatest number (39.1 percent) assigned 3-4 subject headings, descriptors, etc., per report. However, close to 40 percent of all non-Federal U. S. library respondents assigned five or more terms per report (2.3 percent assigned over 15 terms) reflecting the specialized subject approaches provided for the technical reports literature within the non-Federal U. S. recipient population, as compared to the maximum of four terms assigned by the GPO Depository Library recipient population.

When the non-Federal U. S. recipient libraries were analyzed in terms of the industrial and educational sectors, only eight educational or nonprofit libraries, compared to 92 industrial libraries assigned more than five subject terms per report.

In descriptive cataloging of the technical report literature, the greater amount of processing performed by the non-Federal U. S. recipient libraries found within the industrial sector, as compared to GPO Depository Libraries, is reflected in the statistics in Table 53. Entries were prepared most frequently for report numbers (80.3 percent) followed by corporate authors (70.8 percent), personal authors

(67.0 percent) and contract numbers (23.5 percent). Report number entries also predominated in the GPO Depository Library responses.

**Technical Report Holdings**

For a considerable portion of library recipients of the abstracting and indexing services under study, the technical report literature constituted a significant part of the respective library scientific and technical resources. Of 273 reporting non-Federal U. S. recipient libraries, a total of 107 libraries, or 40.0 percent held more than 15,000 technical report titles in either full size or microfiche copy. Forty-two libraries, or 15.2 percent, held over 100,000 titles (Table 59).

An analysis of the Federal agency document collections held by non-Federal U. S. recipient libraries revealed that DOD reports constituted less than one-half of the collection in less than fifty percent of the libraries; 56 percent reported that their collections were less than 20 percent NASA reports. Approximately half the reporting libraries had less than 20 percent of the collections as AEC technical reports. Thus, Department of Defense reports, NASA and AEC reports, constituted, in the order stated, the most significant technical

report holdings retained by the responding libraries (Table 60).

### Library and Information Center Staffing

What was the level of professional staffing for the libraries and information centers receiving the abstracting and indexing services? Close to half of the 335 non-Federal U. S. responding libraries employed one or less professional full-time employee; approximately three quarters employed four or less professional employees (Table 61). Yet, from data compiled in Table 62, it is evident that close to two-thirds of the non-Federal U. S. recipient libraries had an actual or potential clientele ranging from 100 to over 10,000 scientists and engineers each, exclusive of professional administrative staff as well as sub-professional and technical supporting personnel. When criticism is leveled at insufficient utilization of abstracting and indexing services within recipient organizations or institutions, or when intensified information services are not generally available to their scientific and technical personnel, one needs to bear in mind the fact that close to half of the non-Federal U. S. recipient libraries employ one or less professional librarian whose responsibility

### Recipient Population

encompasses the entire range of library or information center operations.

### Summary

In order to acquire qualitative data regarding recipient creativity, educational background, employer research environment and use made of the abstracting and indexing services by recipient personnel, the questionnaire method was employed as a data-gathering device. After pretesting, a Recipient Questionnaire was mailed to a stratified random sample of 1,153 non-Federal U. S. recipients, and to a random sample of 91 GPO Depository Library recipients. Sixty-eight percent of the non-Federal U. S. recipients and sixty-six percent of the GPO Depository Library recipients returned usable questionnaires. The Recipient Questionnaire data were coded and frequency distributions were obtained with the aid of data processing equipment. Some of the findings resulting from the analysis of the Recipient Questionnaire are recorded below:

#### Individual Recipient Characteristics

##### Occupation

The non-Federal U. S. recipient of any one of the abstracting and indexing services is likely to be a librarian (forty-seven percent), a research scientist or engineer (twenty-two percent), or a manager and administrator (twenty percent).

##### R & D Activity

Approximately half the recipients personally carried out research and development work. When confined to non-librarian respondents, the percentage of those engaged in research and development tasks was sixty-nine percent for individuals in industrial establishments and eighty-five percent for individuals in educational and non-profit institutions, or an average of seventy-seven percent.

##### Subject Specialization

Major areas of respondent subject specialization were, in rank order: Library or information sciences (30.2 percent), Electronics and electrical engineering (10.8 percent), Chemistry and chemical engineering (10.5 percent), Mechanical, civil, and marine engineering (8.6 percent), Materials and metallurgy (7.2 percent), Aeronautics

## Recipient Population

(6.3 percent), and Physics (5.3 percent).

### Education

Nearly every respondent held an undergraduate degree; one-fourth held doctorate degrees. The largest segment of respondents (approximately forty percent) earned their degrees during the period 1950-1959, thus placing them in the 30-40 year age group.

### Publishing and Innovation Record

More than forty percent of all non-Federal U.S. respondents had written or edited technical reports within a specified twelve month period; more than a fourth had been authors, coauthors, or editors of one or more professional journal articles; eleven percent had submitted patent applications within a specified twelve month reporting period.

### Scope of Individual Tasks and Information Needs

Forty-two percent of all non-Federal U.S. respondents had a need to undertake a line of research that was definitely outside the field of their specialization; sixty-one percent had a need for information outside the field of their specialization.

## Recipient Organization Environment

### R & D Activity

Eighty-two percent of the respondent host organizations carried out research and development work for Federal government agencies; eighty-eight percent conducted internally-sponsored research; about half conducted R & D for other private industrial organizations and institutions.

### Recipient Organization Publishing and Innovation Record

Staffs employed in eighty-nine percent of all companies and institutions had published one or more professional papers within a specified twelve month period; eighty-one percent had submitted patent applications.

### Size of Recipient Organizations

Compared to the nonrecipient organizations, the majority of recipient organizations and institutions employed huge staffs of professional scientific and technical personnel. Close to half of the non-Federal U.S. recipient host organizations employed more than 300

#### Recipient Population

scientists and engineers, exclusive of administrative and supporting personnel.

#### Use of Abstracting and Indexing Services

Ninety-one percent of all non-Federal U. S. respondents had made some use of the abstracting and indexing services within a specified six month period.

The use of the abstracting and indexing services to meet current awareness needs was predominant over all other uses, including the use of the services for retrospective reference and information retrieval.

#### Types of Information or Data Sought

"Specific data or findings" was the most frequently sought category of information, followed by Reviews, state-of-the-art, as the second highest ranking category; more than half of the desired data were sought outside the respondent's field of specialization.

#### User's Approach to Abstracting and Indexing Services

More than half of the respondents made use of the indexes to look up specific items of interest; less than half of the respondents made use of the Table of Contents for scanning purposes.

#### Value of Indexes

Subject indexes ranked well above the personal author, corporate author, report number, and contract number indexes in frequency of daily, weekly or monthly use.

#### Subject Scope Preferences for Abstracting and Indexing Services

Four percent of all non-Federal U. S. respondents and six percent of non-librarian respondents preferred to receive abstracts exclusively within their particular subject fields; close to two-thirds of all non-Federal U. S. respondents and close to half of non-librarian respondents approved of the present formats of the respective abstracting and indexing services.

#### Recipient Organization Library and Information Services

Ninety-six percent of all recipient companies and institutions maintained library or information centers. Seventy percent of the libraries or information centers were staffed by professional librarians or information specialists.

### Recipient Population

With certain qualifications, the vast majority of respondents found it rather easy to acquire publications cited in the abstracting and indexing services.

### Library Facilities, Policies and Procedures

Some cataloging of technical reports was performed by eighty percent of non-Federal U. S. recipient libraries and 53 percent of GPO Depository Libraries.

Industry<sup>1</sup> recipient libraries provided more intensified technical report literature services than educational and nonprofit institution libraries.

Approximately a third of non-Federal U. S. recipient libraries and three quarters of the GPO Depository Libraries did not permit circulation or routing of the abstracting and indexing services of NSA, STAR, TAB, and USGRDR.

### Technical Report Holdings

Forty percent of the non-Federal U. S. recipient libraries held more than 15,000 technical report titles; fifteen percent held over 100,000 titles.

Department of Defense reports, NASA reports, and AEC reports, in the order stated, constituted proportionally the major technical report holdings of the recipient libraries.

### Library and Information Center Staffing

Close to half of the non-Federal U. S. recipient libraries employed one or less professional librarian; three quarters employed four or fewer professional librarians.

More than half of the recipient libraries had an actual or potential clientele of over 200 scientists and engineers, exclusive of administrative and supporting personnel.

---

1. "Primary Activity" was defined as the activity to which the respondent devoted most time.

2. Columbia University. Bureau of Applied Social Research. The Flow of Information Among Scientists. New York, May 1958, p. 148.

## Chapter 6

### The Nonrecipient Population

Since a comprehensive file of recipients of NSA, STAR, TAB, and USGRDR has been available, an effort was undertaken to identify research-oriented, non-Federal U. S. industrial establishments, research laboratories, etc., which did not receive any of the services. Once identified, these organizations could offer a basis for a statistical evaluation of the nonrecipient population and provide a universe from which the Nonrecipient Questionnaire sample could be drawn.

Fortunately, basic tools had become available within the last two years to aid in this task. Revised editions of the Industrial Research Laboratories of the United States, and the compilation, Roster of U. S. Government Research and Development Contracts in Aerospace and Defense, had been issued by Bowker Associates. Also published in 1965 was the second edition of the Gale Research Co., Research Centers Directory, containing a listing of more than 3,000 educational and nonprofit research centers. The List of Small Business Concerns Interested in Performing Research and Development, published in 1963 by the U. S. Small Business Administration, was also most useful. Each of these directories was searched against the Non-Federal U. S. Recipient File.

#### Directory Analysis

The directory, Industrial Research Laboratories of the United States, lists 3,260 industrial firms which the editors believe to represent "more than 95 percent of the dollar volume of the U. S. industrial R & D effort."<sup>1</sup> The entries in this directory are arranged alphabetically under the name of the parent company, with more than 700 cross references provided from divisions, subsidiaries, or affiliates. The directory listing is alphabetized in accordance with the filing principles utilized in organizing the Non-Federal U. S. Recipient file.

A decision was made to consider a company a "nonrecipient"

#### Nonrecipient Population

If none of the services under study were received by the parent body, its subdivisions or affiliates. The receipt of any one service within any one segment of a company, regardless of site location, excluded that firm from the "nonrecipient" population. A search of the 3,260 firms listed in Industrial Research Laboratories of the United States against the 7,949 addresses found in the Non-Federal U. S. Recipient File revealed that 2,236 firms, or 68.6 percent, did not receive any of these abstracting and indexing services.

Since entries in the Industrial Research Laboratories of the United States include Federal government contractor information, a second search identified Federal agency contractors and compared them with the Non-Federal U. S. Recipient File. The search revealed that of 1,383 contractor firms listed, a total of 704, or 50.9 percent, were found to be nonrecipients of the services. Of 1,877 non-contractor firms listed, 1,557 or 83.0 percent were found to be nonrecipients of any of the services.

Another source for Federal contract information was the Roster of U. S. Government Research and Development Contracts in Aerospace and Defense.<sup>2</sup> This publication lists 7,500 contracts awarded to 1,096 firms and institutions during fiscal year 1964 by over 300 procurement centers of the Army, Navy, Air Force, Federal Aviation Agency, Atomic Energy Commission, and the National Aeronautics and Space Administration. Of the 1,076 Federal government contractors located in the United States, a total of 367, or 34.1 percent were found to be nonrecipients.

Of 1,096 entries listed in Roster of U. S. Government Research Contracts in Aerospace and Defense, 623 or 56.8 percent were found to be listed in Industrial Research Laboratories. Much less overlap of firms was found between these directories and the List of Small Business Concerns Interested in Performing Research and Development.<sup>3</sup> An entry-by-entry comparison revealed that of 2,715 industrial firms found in the latter directory, 1,772 or 63.9 percent were not included in Industrial Research Laboratories of the United States. Of course, the U. S. Small Business Administration directory lists many firms whose primary activity involves as much manufacturing

#### Nonrecipient Population

as research. Of the 2,775 industrial firms included in List of Small Business Concerns Interested in Performing Research and Development, 2,397 or 86.4 percent were found to be nonrecipients.

To gain some insight into the pattern of receipt or nonreceipt for educational and nonprofit research-oriented organizations, the Research Centers Directory was searched against the Non-Federal U.S. Recipient File. Listed in this directory are 3,188 organizations, including "research institutes, centers, foundations, laboratories, bureaus, experiment stations and similar nonprofit research facilities, activities formally identified by specific or distinctive names or titles established on a permanent basis as separate entities for carrying on continuing research programs in all fields of endeavor."<sup>4</sup> Of the 3,188 research centers listed, 3,014 were located in the U. S. Of these, 2,950 or 92.1 percent were nonrecipients of any of the services.

Though characterizing themselves as fully independent, many of the research centers were associated with universities. Quite likely the staffs of these centers have some measure of access to the abstracting and indexing services through university libraries or individuals in university departments receiving the services. Ease of access, however, has been proven to be directly related to degree of use made of bibliographic services. It is therefore unlikely that the percentage of nonrecipient and, in essence, under-utilizing research centers, now calculated to be 92.1 percent, would undergo significant change.

Other nonrecipient organizations could have been located by searching regional, state, city, industrial or institutional directories. One must bear in mind that there are approximately 312,000 manufacturing companies in the United States<sup>5</sup> and about 2,200 institutions of higher learning.<sup>6</sup> In a single academic year, a total of 12,822 Doctoral degrees and 91,418 Masters' degrees have been conferred.<sup>7</sup> Approximately 400,000 scientists and engineers are engaged in research and development; about 280,000 of them are working on Government-sponsored research;<sup>8</sup> yet, the entire Non-Federal U. S. Recipient File comprises 7,949 addresses representing a total of only

### Nonrecipient Population

3,004 different industrial organizations and educational institutions.

Is it ignorance of the availability of the federally-produced abstracting and indexing services that accounts for the relatively large nonrecipient population? Do the information needs of the nonrecipient population differ markedly from those of the recipient population? It is, after all, the industrial firm that must close the gap in the civilian technology lag and infuse into the private sector of our economy the technology and innovations resulting from government-sponsored research.<sup>9</sup>

A 10 percent random sample of 480 industrial nonrecipient firms was selected from Industrial Research Laboratories of the United States, Roster of U. S. Government Research and Development Contracts in Aerospace and Defense, and List of Small Business Concerns Interested in Performing Research and Development. These directories are believed to include entries for practically all U. S. research-oriented industrial organizations. Ostensibly, these organizations have a need for the abstracting and indexing services under study and, consequently, are potential recipients of these services.

### Nonrecipient Questionnaire Mailings

In August 1966, the Nonrecipient Questionnaires and cover letters (Appendix D) were mailed to the supposed 480 industrial nonrecipient firms. The questionnaires were addressed to the Director of Research or to an analogous or higher management official. As in the case of the Recipient Questionnaire, a single follow-up letter (appendix C, no. 3) was sent to the nonrespondents one month after the initial mailing of the questionnaires.

### Nonrecipient Questionnaire Returns

A total of 250 or 56.1 percent responded to the Nonrecipient Questionnaire, submitting 235 or 52.7 percent completed questionnaires. For a variety of reasons, including mergers, changes of address, dissolutions, etc., 34 Nonrecipient Questionnaires could not be delivered. A considerable number of the nonrecipient respondents commented freely on many aspects of information acquisition, dissemination, and use.

Since the sample was confined to nonrecipients, the question

### Nonrecipient Population

of representativeness for each of the abstracting and indexing services does not apply. The 235 questionnaire responses, account for 52.7 percent of the random sample of nonrecipients are deemed statistically adequate to provide insight into the nature of the nonrecipient population.

### Nonrecipient Questionnaire Analysis

#### Individual Nonrecipient Characteristics

While Recipient Questionnaire respondents were divided almost equally between library and non-library personnel, Nonrecipient Questionnaire respondents were overwhelmingly non-librarians (Table 63). The primary activity of the majority of the respondents was in the field of Management and administration (63.0 percent), with a total of 27.2 percent of respondents indicating Research and development as their prime activity (Table 64). Although the instructions for the Nonrecipient Questionnaire called for completion by the individual concerned with the "acquisition and dissemination of scientific and technical information needed by the organization in support of research and development activity," the fact that the questionnaires were addressed to senior management officials may have produced a preponderance of management responses. It should be noted, however, that as defined in the Nonrecipient Questionnaire, "Management and Administration" embraces such scientific and technical job titles as Chief Chemist, Chief Metallurgist, Project Engineer, etc. Often it is difficult to differentiate between the managerial and research activity of these types of positions.

Table 63

#### Nonrecipient Questionnaire Respondents, by Broad Institutional Groupings

	No. of Respondents	Percent

Total	235	100

Nonrecipient Organization Characteristics

Table 65 discloses, in rank order, the primary subject specialization of the industrial establishments within which the Nonrecipient Questionnaire respondents were employed. While the nonrecipient sample companies have been selected at random, it is worth noting that the greatest number of respondent firms are to be found in the fields of Electronics and electrical engineering (24.4 percent), Chemistry and chemical engineering (16.2 percent), Mechanical, industrial, civil and marine engineering (15.8 percent), etc. The rankings of subject fields for the nonrecipient industrial firms do not differ in any

#### Nonrecipient Population

marked degree from the ranking of industries by subject field for all U. S. recipient industrial establishments (See Table 9). Neither are there important differences in the geographic distribution of the randomly selected nonrecipient sample or Nonrecipient Questionnaire returns (See Table 37A, Appendix A) when compared with the geographic distribution of all non-Federal U. S. recipients (Table 12A, Appendix A). With respect to size of the organization, however, as measured in terms of number of scientists and engineers employed, nonrecipient companies were, by far, the smaller organizations. Whereas 81.3 percent of nonrecipient companies and institutions employed fewer than 20 scientists and engineers (Table 66), a total of 16.3 percent of recipient organizations employed that number; whereas 1.7 percent of nonrecipients employed 500 or more scientists and engineers, a total of 36.4 percent of recipients employed that number. Obviously, a definite relationship exists between size of a company and the receipt of the abstracting and indexing services.

#### Nonrecipient Organization R & D Activity

To what extent were the nonrecipient organizations engaged in research and development? 87 percent of non-Federal U. S. respondents, compared to an equal percent of nonrecipient U. S. respondents, stated that their employers conducted in-house or internally sponsored research (Table 67). Somewhat above half of the nonrecipient organizations (54.6 percent) compared with half (50.4 percent) of non-Federal U. S. recipients performed R & D for other private organizations and institutions (Table 68). However, a rather sharp distinction can be noted with respect to research and development performed for the Federal government by nonrecipient and recipient organizations: while two-thirds (67.1 percent) of the nonrecipient organizations held no Federal agency contracts, only 18.0 percent of the recipient organizations held no such contracts (Table 69). Thus, unlike recipient organizations, nonrecipient organizations held few Federal government contracts.

Estimates of nonrecipient organization staff time devoted to research and development activity are portrayed in Table 70. Since many of the respondents indicated management and administration as

### Information Services

Lacking the federally-produced abstracting and indexing services, how adequate were the internally organized library and information service facilities? When asked whether the nonrecipient organization maintained a library or information center, 74.9 percent of respondents answered affirmatively (Table 73), compared to a 96.4 percent response from non-Federal U. S. recipients. However, only 12.1 percent of the nonrecipient libraries, compared to 70.3 percent of non-Federal U. S. recipient libraries, were professionally staffed (Table 74). It can be inferred that one of the possible reasons for nonreceipt of the services is lack of professional librarian advice.

## Familiarity with a Use Made of Abstracting and Indexing Services

Although not receiving any of the abstracting and indexing services, were the respondents acquainted with any of them? A total of 86.2 percent indicated that they were not acquainted with NSA, 86.0 percent were not acquainted with TAB, 77.1 percent were not acquainted with STAR, and 70.5 percent were not acquainted with USGRDR (Table 76). Of those who stated that they were acquainted with one or more of the services, 89.1 percent had made no use of them within a specified six month interval (Table 77).

## Types of Information Needs

What types of information were needed by the nonrecipient population? How frequently were they sought? If an abstracting and

Nonrecipient Population

indexing service were made available to the respondent, what would be his preference with regard to subject coverage?

As in the case of the recipient population, the majority of nonrecipient respondents indicated a preference for abstracting and indexing services which would cover the subject specialty within the broader primary field of interest (Table 79).

Table 79  
Nonrecipient Questionnaire Respondents, Preference for Subject  
Scope Coverage for Abstracting and Indexing Services

Total	212 <sup>(a)</sup>	

<sup>(a)</sup> Percent and total based on number of respondents.

Table 80 indicates the frequency with which respondents seek information and the reasons underlying the search. Most frequently sought was 1) information directly pertinent to current project or research and 2) information for the purpose of keeping abreast of current literature in the primary field of interest.

When asked to rank information needs in order of importance to the individual nonrecipient, the two categories referred to above also attained the highest rankings (Table 81).

With respect to types of information sought, specific data or findings were sought by more than half (53.1 percent) of the nonrecipient respondents. The second most frequently sought information type was information relating to laboratory techniques, procedures, apparatus, etc., (30.5 percent) (Table 82). Approximately 60 percent of

Research Centers Directory revealed that ninety-two percent were nonrecipients of any of the services.

To test, in part, the hypothesis that Federal government contractors were the primary recipients of the abstracting and indexing services, directories identifying Federal government contractor organizations were searched against the Non-Federal U. S. Recipient File.

A search of over a thousand U. S. firms listed in Roster of U. S. Government Research and Development Contracts in Aerospace and Defense revealed that thirty-four percent were nonrecipients of any of the services.

A search of over one thousand firms listed in Industrial Research Laboratories of the United States designated as performing R & D for the Federal government revealed that about half were nonrecipients of any of the services. A similar search of about 2,000 firms, listed in the above directory, which did not carry out Federal government research, revealed that eighty-three percent were nonrecipients of any of the services.

### Individual Nonrecipient Characteristics

Management and administration was the primary activity of close to two-thirds of the nonrecipient respondents. (As defined in the Nonrecipient Questionnaire, "Management and administration")

Nonrecipient Population encompassed such positions as Chief Chemist, Chief Physicist, Project Manager, etc.)

#### Nonrecipient Organization Characteristics

In rank order, nonrecipient organizations specialized in the following fields: Electronics and electrical engineering (24.4 percent), Chemistry and chemical engineering (16.2 percent), Mechanical, industrial, civil and marine engineering (15.8 percent). The rankings of the nonrecipient organization subject field specialties do not differ markedly from those for recipient organizations.

The vast majority of nonrecipient organizations (81.3 percent) employed fewer than twenty scientists and engineers. This finding contrasts sharply with recipient organization staffing, often running into hundreds of professional scientific and technical positions.

#### R & D Activity

Eighty-seven percent of nonrecipient organizations carried out internally-sponsored research; about half performed R & D for other private organizations and institutions. However, only eighteen percent of nonrecipient organizations, compared to sixty-seven percent of recipient organizations, performed R & D for the Federal government.

#### Scope of R & D Tasks and Information Needs

Within a specified twelve month period, a total of twenty-nine percent of the nonrecipient organizations had to undertake a line of research outside the field of their specialization; sixty-three percent had a need for data or information outside their field of specialization.

#### Information Services

While three-quarters of the nonrecipient organizations maintained libraries, only twelve percent of the libraries were staffed by professional librarians; thirteen percent of the respondents stated that their information needs were "inadequately" met, and three percent thought the information services to be "excellent." Specific data or findings directly pertinent to current projects or research was the category of information most frequently sought.

#### Familiarity with Abstracting and Indexing Services

The vast majority of nonrecipient respondents had no knowledge

#### Nonrecipient Population

of the abstracting and indexing services: eighty-six percent had no knowledge of NSA or STAR; seventy-seven percent had no knowledge of TAB; seventy-one percent had no knowledge of USORDR, and sixty percent of the respondents expressed a desire for additional information about one or more of the abstracting and indexing services.

## Chapter 7

### Summary, Conclusions and Recommendations

Diffusion and utilization of scientific and technical information appear to be prime variables influencing individual corporate as well as national economic growth. The circumscribed yet important role played by abstracting and indexing services in the diffusion process has been noted and the distribution and use patterns of the federally-produced abstracting and indexing services of NSA, STAP, TAB, and USGRDR have been analyzed on the basis of available recipient population data and through use of the questionnaire method. The research-oriented nonrecipient population was identified and some of its characteristics determined and compared with those of the recipient population. The analysis, while confined primarily to the United States, took cognizance of the distribution and use made of abstracting and indexing services within a number of Soviet bloc countries which rely heavily upon such services as basic media for scientific and technological communication.

While it is recognized that national systems for dissemination of information should be evaluated only within their own unique sociopolitical environments, this does not preclude comparative analysis of components of variant systems which are frequently designed to attain similar objectives and are faced with similar problems.

On the basis of statistical evidence derived from the analysis of the Non-Federal U. S. Recipient File (See Chapter 4) and data available from official Government sources and industrial compilations, the following overall potential U. S. recipient populations and their actual recipient segments are contrasted in relation to the first hypothesis:

Research centers	3,014
Recipient centers	64
Percent of recipients	2.1
Manufacturing establishments	312,000
Recipient establishments	2,154
Percent of recipients	0.7

#### Summary

Industrial research laboratories	3,280
Recipient laboratories	1,024
Percent of recipients	31.4
Small business concerns interested in performing research and develop- ment for the Federal government	2,775
Recipient business concerns	378
Percent of recipients	13.6
R & D scientists and engineers	344,900
Total number of U. S. copies dis- tributed	26,340 <sup>(1)</sup>
Percent recipients	7.6
Scientists and engineers in private industry	871,400
Total number non-Federal and GPO Depository Library copies distributed	20,280 <sup>(2)</sup>
Percent recipients	2.3

#### Distribution and Use Pattern

Obviously, a distribution of national documentation center abstracting and indexing services which reaches two percent of U. S. educational and nonprofit research centers, thirty-one percent of industrial research laboratories, and less than one percent of U. S. manufacturing establishments, cannot be termed adequate. Neither, on the basis of geographic distribution, can we consider adequate a distribution in which five U. S. states contain nearly fifty percent of the population receiving abstracting and indexing services and eighteen states each contain less than one half of one percent, or about three percent of the recipient population.

While arguments have been presented before Congressional committees championing the allocation of grants to proven researchers, and opposing distribution of research and development funds on a regional basis,<sup>3,4</sup> these arguments do not apply to the distribution of abstracting and indexing services. The same Congressional hearings also provide ample evidence that research and development talent and capability is not confined to a select number of institutions or to a few states. Even if that were the case, greater diffusion and application of research results in all states might well lead to increases in productivity and a resultant increased rate of national economic growth.

Recipient Types

Without question, Federal government contractors are the primary recipients and users of these abstracting and indexing services. Eighty-two percent of the organizations and institutions within which the recipients were employed were Federal Government contractors. Almost the entire STAR non-Federal U. S. distribution (95.6 percent) went to NASA contractors or individuals having some official connection with that agency. The distribution of TAB is limited to those who have either current Federal agency contracts or who have established their eligibility with the Defense Documentation Center as potential Department of Defense contractors. A search of over a thousand contractor firms included in Roster of U. S. Government Research and Development Contracts revealed that two-thirds of the contractor firms were recipients of one or more of the abstracting and indexing services. Conversely, of close to nineteen hundred noncontractor firms in Industrial Research Laboratories of the United States, eighty-three percent were nonrecipients of the services. Two-thirds of the companies represented in the Nonrecipient Questionnaire returns did not have current contracts with the Federal Government. An average of eighty percent of Nonrecipient Questionnaire respondents had no knowledge of any of the abstracting and indexing services.

Other compilations of data indicate that not only in terms of total number of recipients, but in terms of total number of copies, and number of copies per recipient, firms and institutions having an official connection with the Federal government ranked well above non-contractor organizations. Thus, approximately forty percent of all non-Federal U. S. TAB recipients received two or more copies of TAB; over one hundred recipients acquired from ten to a hundred or more copies (Table 20A, Appendix A). About two-thirds of the TAB copies were addressed directly to individuals rather than to libraries. The inference can be drawn that the receipt of multiple copies of TAB within the same organization would permit their utilization for both current awareness and information retrieval purposes. It is, of course, possible that with the receipt of a single issue of any one service, a library or information center can attain wide dissemination

### Summary

of the abstracted information. Internal dissemination of abstracts is being carried out, however, by a small portion of the library recipient population.<sup>5</sup>

Responses to the Recipient Questionnaire also revealed that close to half of the non-Federal U. S. recipient libraries employed one (or less) professional full-time librarian and that about two-thirds of all libraries had an actual or potential clientele ranging from 100 to 10,000 scientists and engineers, exclusive of professional administrative and supporting personnel. It can be inferred that serious understaffing at the local library or information center level tends to inhibit selective dissemination of abstracts, or for that matter, any other intensive information service.

In sharp contrast to the multiple distribution of NSA, STAR, and TAB copies, practically all subscribers to USGRDR (96.8 percent) purchased a single copy of the service. Since about half of the USGRDR subscription copies were addressed to libraries and since a third of non-Federal U. S. recipient libraries and close to four-fifths of the GPO Depository Libraries did not permit circulation or routing of USGRDR, it is not unreasonable to state that the receipt of single copies of USGRDR and the restrictions imposed on circulation and routing would preclude its extensive use as current awareness or announcement medium.

With respect to STAR which is disseminated almost entirely on the basis of official distribution, about sixty percent of its recipients were individuals outside the library or information services field. While an equivalent percentage of NSA recipients were libraries and information centers, through official AEC distribution channels, many of the recipient organizations acquired multiple copies of NSA, with five libraries or information centers acquiring more than one hundred copies each.

### Abstracting and Indexing Services in Relationship to Other Variables

The evidence collected indicates a positive correlation of the distribution and use pattern for the abstracting and indexing services investigated and other economy input variables known to influence innovation and national economic growth.

### Summary

Other investigators have demonstrated the effect of the "technical progress" variable upon economic growth of nations or individual corporate enterprises. Research and development constitutes one of the major components of the "technical progress" variable. Whether on a regional, national, or industry segment level, a definite relationship has been found to exist between the "technical progress" input variable and the resultant rate of economic growth. National expenditures in relation to the per capita Gross National Product (GNP) have been shown to be higher in countries having a high per capita GNP than in countries having a low per capita GNP. The more industrialized nations of the world, such as the United States, Great Britain, Japan, France, the Netherlands and Canada, spent more than one percent of their GNP on research and development, while underdeveloped nations spent less than 0.25 percent. In terms of foreign distribution of the abstracting and indexing services of NSA, STAR, and USGRDR, the highly industrialized nations attained top ranking as recipients of the services.

A close relationship has also been found to exist between the degree of industrialization of U.S. states and regions and the state or regional distribution of the abstracting and indexing services. States and regions having a high proportion of scientists and engineers, research and development funds, manufacturing establishments, have also been found to have a high concentration of recipients of the abstracting and indexing services.

Industries such as Electrical equipment and communications, Chemicals and allied products, Machinery, Professional and scientific instruments, Aircraft and missiles, have been found in other studies to be the primary innovating and economically expanding industries and they are the primary recipients of these abstracting and indexing services.

Evidence gathered on the diffusion and use made of abstracting and indexing services in Soviet bloc countries points to extensive and purposeful exploitation of this medium as a primary means for scientific and technological communication. Not merely the scientist and engineer, but the factory foreman and graduate student is the

### Summary

recipient of these services. During 1967, the All-Union Institute of Scientific and Technical Information (VINITI) expects to publish its major abstracting and indexing service, Referativnyi Zhurnal, in a total of 25 series, 35 comprehensive subject volumes, and 134 subsections, which are to be disseminated to approximately 375,000 Soviet recipients. This is exclusive of Ekspress Informatsiya (Express Information) and related services. By way of contrast, the total number of U. S. recipients for all four services of NSA, STAR, TAB, and USGRDR amounts to 12,255 recipients.

### Need for Purposeful Dissemination

Federal documentation centers may be doing a creditable job in supporting the missions of their agencies. However, it is obvious that thousands of research-oriented industrial organizations, educational and nonprofit institutions and private individuals, do not receive the federally-produced abstracting and indexing services and, what may be more significant, have no knowledge of their existence.

Recognizing, as other countries seem to have recognized, the powerful effect of the "technical progress" variable on national economies, can we as a nation afford a laissez faire attitude toward the dissemination of abstracting and indexing services reporting research results stemming from fifteen billion dollar annual R & D expenditures? Are Federal agency contractors and those having official ties with the Federal government to be the primary and favored recipients of these services? Conversely and examined within a broader context, does not the U. S. Federal government have a responsibility for diffusing nationally the results derived from tax-supported research?

The issue to be considered is whether, in a free society, we should not deliberately adopt measures to attain a high degree of dissemination of scientific and technical information. Testifying on the possible influence of Federal research and development programs on the U. S. business community, Eugene P. Foley, Administrator, Small Business Administration, notes:

It must be recognized that the knowledge gained from Government expenditures in space and military research

## Summary

and development can, in many cases, be transferred directly into industrial application. This information contains the potential for creating new industrial techniques, materials, products, and processes. If assimilated properly, it can exert a profound influence on our civilian technology. The Federal Government, therefore, has an obligation to develop a workable system of utilizing this enormous reservoir of scientific information so that its benefits can be transmitted to businessmen both large and small in order to provide the ingredients necessary for an accelerated growth in our civilian economy.<sup>6</sup>

Both from within or outside the Federal government, many individuals have expressed concern over the widening gulf between militarily-oriented research and civilian application. The need to meet competition from nations emphasizing research directed toward civilian product development has become apparent within recent years. In testimony before Congress, the Secretary of Commerce noted that a number of other nations have been able to adopt scientific advances to practical use more speedily than the United States and offered this as a partial explanation why such nations were able to compete against the United States "in both price and quality."<sup>7</sup> A recent Columbia University Seminar on Technology and Social Change,<sup>8</sup> as well as articles in the professional literature,<sup>9</sup> have advanced the theme that the United States is lagging behind a number of European countries in technological inventiveness and innovation in the civilian field. A study for the National Commission on Technology, Automation, and Economic Progress recommends that more effective transfer and utilization of new technology be made a "national goal established at the highest levels" and points out that optimum use of scientific and technical information is not likely to occur naturally. With respect to time lag between development and adoption of new technology, the study notes that "history proves quite emphatically that there will likely be a longer time lag between development of new technology and its civilian application via natural processes than would occur with some form of catalytic action."<sup>10</sup>

### Factors Inhibiting Dissemination

In considering various "catalysts" capable of stimulating

### Summary

national economic growth, it should be apparent that the economic growth rate when government does little or nothing to influence it is not necessarily the "best" rate. "Certainly," Denison<sup>11</sup> states, "

a democratic society is entitled to make a collective decision to use the instruments of government and other institutions to promote rapid growth. Moreover, if such a policy commands popular assent, a free society can use most, though not quite all, the effective techniques to stimulate growth that are open to a dictatorship, and do so without more impingement on freedom than is implied by the existence of government with the power of compulsory taxation.

The federally-produced abstracting and indexing services of NSA, STAR, TAB, and USGRDR are supported by public funds; the publications which they abstract are primarily technical reports, also stemming from government-sponsored and publicly-supported research. Neither the technical report literature nor the abstracting and indexing services under consideration are subject to copyright restrictions. Utilizing either existing or revised abstracting and indexing service formats, the Federal government can adopt whatever measures it deems appropriate to attain wide diffusion of these services.

While the belief is widespread that information resulting from Government-sponsored research is a national resource and should be fully disseminated to both contractor and noncontractor establishments, no Federal agency has concerned itself with the overall task of national diffusion or dissemination.

Under Title IX of the National Defense Education Act of 1953, the National Science Foundation was authorized to undertake programs to develop new or improved methods and to provide or arrange for the provision of helpful information services. Executive Order 1087 of March 13, 1959 directed the Foundation to provide leadership in efforts to attain coordination and improvement in Federal Government scientific and technical information activities. The Executive Order cited above also directed other Federal agencies "to cooperate" and assist the Foundation in its government-wide responsibility. Regrettably, as noted in the "Crawford" report,<sup>12</sup> the NSF staff, because of its primarily advisory function, was hardly in a position to

## Summary

establish or implement a vigorous information diffusion program.

Public Law 776 of September 1951 directs the Secretary of Commerce to establish and maintain a scientific clearinghouse for the benefit of the business community. As Congressional testimony elicited from the Director of the Office of Technical Services indicates, the "clearinghouse" role played by the Department of Commerce was, at best, quite limited.<sup>13</sup>

Consistent with security regulations, the Department of Defense seeks to disseminate information resulting from DOD projects. Legally, however, DOD has no obligation to do so. This point was stressed quite emphatically by the Director of Technical Information, Office of Director Defense Research and Engineering, in testimony before Congress.<sup>14</sup> Even if the Department of Defense were to disseminate information relating to its research programs, under present procedures the Defense Documentation Center receives "slightly more than one-half of the total documents being generated."<sup>15</sup> Thus, at best, only about half of the DOD technical reports published are abstracted and indexed in the issues of TAB. Of course, only the open literature, or less than half of the abstracts announced in TAB are announced in USGRDR; during 1963, of a total of 60,436 technical reports generated by Federal agencies, 38,800 were completed by the Department of Defense. Of this total, 62 percent were controlled for various reasons.<sup>16</sup>

The Atomic Energy Commission and the National Aeronautics and Space Administration are among the agencies specifically authorized by Congress to disseminate information resulting from agency-sponsored programs. However, since they are essentially mission-oriented, the agencies emphasize service to contractors, who can aid the respective agencies to fulfill their missions. The tenth and final report of the House Select Committee on Government Research notes:

In the sense of mission-oriented programs, we are spending greatly on the defense, space, and nuclear missions and virtually nothing on the mission of securing our probable competitive future. That mission is neither the mission of DOD, of NASA, of AEC, nor

## Summary

of HEW. If it is the explicit mission of any department or agency - Commerce, for instance - we are not aware of it.<sup>17</sup>

The passage of the State Technical Services Act of 1965, the establishment of federally-supported information centers (more recently called information analysis centers) and the creation of offices such as NASA's Technology Utilization Division or the AEC's Office of Industrial Cooperation, are efforts at more adequate diffusion and utilization of R & D results. These are uncoordinated and fragmented activities. While on the one hand funds are allotted to universities under the State Technical Services Act,<sup>18</sup> which has the avowed purpose of permitting the "benefits of federally financed research, as well as other research [to be] placed more effectively in the hands of American business, commerce and industrial establishments throughout the country,"<sup>19</sup> on the other hand, the withholding of funds by the Department of Commerce (and Department of Defense) forced the closing of twelve Regional Technical Report Centers supposedly established for the purpose of making accessible the technical report literature to the business community. An analogous action by the Defense Documentation Center disbanded five of its regional offices. The subscription price for USGRDR has doubled in 1966 from \$15.00 to \$30.00, and the cost of the index to that service, GWI, increased from \$16.00 to \$22.00. While NASA and DOD still provide free photocopies of needed reports to qualified users, the AEC no longer does so. In a report of the Committee on Non-GPO Publications presented before the Association of Research Libraries it was noted that:

most of the non-GPO publications do not get into the depository library distribution system administered by the Superintendent of Documents, and there is but fragmentary bibliographical control over them. Report literature resulting from Government-sponsored research and commercial printing done on contract directly with Federal agencies also do not get into depository library channels.<sup>20</sup>

An earlier study by Brock<sup>21</sup> shows the Federal government's program of printing, publishing and distribution of relevant publications to be "seriously deficient when measured against the information

## Summary

requirements of a highly educated, industrialized, complex and space age society." The general problem has been characterized as a quiet crisis which has almost escaped attention, both within and without the government.<sup>22</sup>

## Recommendations

Inadequate distribution of abstracting and indexing services and other federally-produced documents, the parsimonious and generally sporadic support of the information dissemination function, information management decisions which often work at cross-purposes, are in no small measure attributable to the lack of a formalized national policy for information dissemination.

If the view is accepted that scientific and technical information is a national resource which can have a profound influence on the nation's security and national well-being, then:

(1) A national policy needs to be formulated which would have as its aim maximum utilization and exploitation of that resource.

However, as in the case of mere investment in research and development, mere formulation of such a policy would not, by itself, be sufficient to attain desired objectives.

(2) Congressional authority needs to be vested in either an existing agency, or a new agency, whose primary goal would be to implement national policy decisions for the dissemination of scientific and technical information derived from publicly-expended funds. Possibly, the responsibility and scope of the committee on Scientific and Technical Information, now serving primarily in an advisory capacity, should be strengthened and expanded to encompass the new tasks.

Under our governmental system, the Constitution delegates power to the Federal government in order to "provide for the common defense." It is primarily this Constitutional clause that has been used in the past as justification for the huge R & D expenditures. However, the same Constitutional clause also empowers the Federal government to "promote the general welfare."

(3) Rather than raising subscription prices for the federally-produced abstracting and indexing services, they should have lower

**Summary**

prices, or should be provided without charge.

(4) Rather than restricting these and related technical report information services, their dissemination should extend to those U. S. graduate students, industrial firms or educational and nonprofit institutions that may derive benefit from their use.

Our investment in research and development cannot be effective without investment in national diffusion of research results.

	No. of Issues	U. S. Price
1. Avtomatika, Telemekhanika i Vychislitel'naya Tekhnika Automation, Telemechanics and Computer Technology	12	\$ 25.00
a. Avtomatika i Telemekhanika Automation and Telemechanics	12	14.00
b. Vychislitel'naya Tekhnika Computer Technology	12	10.00
2. Avtomobilnye Dorogi Automobile Highways	12	10.00
a. Iskusstvennye Sooruzhenia Na Avtomobilnykh Dorogakh Building Arts for Automobile Highways	12	4.00
b. Stroitel'stvo i Eksploataatsiya Avtomobilnykh Dorog Building and Maintenance of Automobile Highways	12	4.00
3. Avtomobilnyi i Gorodskoi Transport Automobile and City Transportation	12	24.00
a. Avtomobilstroenie Automobile Construction	12	16.00
b. Avtomobilnyi Transport Automobile Transport	12	4.00
c. Gorodskoi Transport City Transportation	12	3.00
4. Biologiya Biology	12	166.00
a. Biofizika Biophysics	12	8.00
b. Botanika Botany	12	12.00
c. Entomologiya Entomology	12	10.00
d. Fiziologiya Cheloveka i Zhivotnykh (nervnaya sistema, organy chuvstv, vnutrenniaya sekretya, razmnozhenie) Human and Animal Physiology (nervous system, sense organs internal secretions, reproduction)	12	18.00
e. Fiziologiya Cheloveka i Zhivotnykh (obshchaya fiziologiya, obmen veshchestv i energii vnutrennie organy, krov) Human and Animal Physiology (general physiology, change of sub- stances into energy, internal organs, blood)	12	18.00
	12	6.00

f. Fiziologiya Rastenii Plant Physiology	12	6.00
g. Morfologiya Cheloveka i Zhivotnykh, Antropologiya, Genetika Cheloveka Human and Animal Morphology, Anthro- pology, Human Genetics	12	12.00
h. Obshchaya Biologiya, Tsitologiya, Genetika, Evolyutsionnoe Uchenie General Biology, Cytology, Genetics, Evo- lutionary Science	12	12.00
i. Radiatsionnaya Biologiya Radiation Biology	12	2.00
j. Virusologiya i Mikrobiologiya Virology and Microbiology	12	20.00
k. Zoologiya Obshchaya, Zoologiya Bezpozvonochnykh, Gidrobiologiya General Zoology, Invertebrate Zoology, Hydrobiology	12	6.00
l. Zoologiya Pozvonochnykh Vertebrate Zoology	12	12.00
m. Zooparazitologiya Animal Parasitology	12	8.00
5. Ekonomika Promyshlennosti Industrial Economics	12	34.00
a. Ekonomika i Organizatsiya Proizvodstva Otrazlei Tyazheloy Promyshlennosti Economics and Organization of Production of the Heavy Industry Sector	12	12.00
b. Ekonomika i Organizatsiya Proizvodstva Otrazlei i Pischevoi Promyshlennosti Economics and Organization of Production of the Light Industry and Food Industry Sectors	12	5.00
c. Mirovaya Ekonomika, Ekonomicheskoe Polozhenie Stran World Economics, Economic Conditions of Nations	12	6.00
d. Obshchotraslevye, Voprosy Ekonomiki i Organizatsii Promyshlennosti General Sector Problems of Economics and Organization of Industry	12	4.00
e. Organizatsiya i Finansirovaniye Nauchnykh i Issledovaniy, Rabota, Kadry, Zaniyatost Organization and Financing of Scientific and Research Works, Employees, Em- ployment	12	3.00
f. Primeneniye Matematicheskikh Metodov v Ekonomicheskikh Issledovaniyakh i Planirovani Application of Mathematical Methods to Economic Research and Planning	12	4.00
6. Elektronika i Ee Primeneniye Electronics and its Application	12	17.00

a. Elektronika, Elektronnyye i Ionnyye Pribory Electronica, Electron and Ion Apparatus	12	10.00
b. Poluprovodnikovyye Pribory Semiconductor Apparatus	12	6.00
7. Elektrotekhnika i Energetika Electrotechnology and Energetics	12	86.00
a. Atomnyye Elektrostantsii Nuclear Power Stations	12	3.00
b. Elektricheskiye Mashiny i Apparaty Electrical Machinery and Apparatus	12	12.00
c. Elektrotekhnicheskiye Materialy, Elektricheskiye Kondensatory, Provoda i Kabeli Electrical Materials, Electrical Con- densers, Wire and Cable	12	5.00
d. Elektricheskiye Stantsii, Seti i Sistemy Electrical Power Stations, Networks and Systems	12	12.00
e. Elektrifikatsiya Byta Electrification	12	3.00
f. Elektrifikatsiya i Avtomatizatsiya Selskogo Khozyaystva Rural Electrification and Automation	12	3.00
g. Elektrotekhnologiya Electrotechnology	12	4.00
h. Elektrooborudovaniye Transporta Electrical Equipment	12	4.00
i. Elektroprivod i Avtomatizatsiya Promyshlennyykh Ustanovok Electrification and Automation of Industrial Enterprises	12	4.00
j. Gidroenergetika i Vetroenergetika Hydro and Air Energetics	12	5.00
k. Kotelnyye Ustanovki i Vodopodgotovka Boiler Installation and Water Treatment	12	4.00
l. Obshchie i Teoret. Voprosy Elektrotekhniki, Novyye Istochniki Topy General and Theoretical Problems of Elec- trotechnology; New Sources of Energy	12	5.00
m. Obshchie i Teoreticheskiye Voprosy Teploenergetiki, Gelienergetiki General and Theoretical Problems of Thermo-energetics; Solar Energetics	12	3.00
n. Svetotekhnika i Infekrasnaya Tekhnika Light and Infrared Technology	12	6.00
o. Teploekhnicheskiye Kharakteristiki Topliva, Ispolzovaniye Gaza i Mazuta v Promyshlennosti Thermo-technological Characteristics of Fuel, Utilization of Gas and Fuel Oil in Industry	12	3.00
p. Teployye Elektrostantsii	12	6.00

Thermal Electrostations		
8. Fizika Physics	12	105.00
a. Fizika Atoma i Molekuly, Optika, Magnitnyi Rezonans Atomic and Molecular Physics, Optics, Magnetic Resonance	12	18.00
b. Fizika Gazov, Zhidkosti, Polimerov i Tverdykh Tel Physics of Gases, Fluids, Polymers, and Hard Solids	12	24.00
c. Fizika Plazmy Plasma Physics	12	6.00
d. Yadernaya Fizika Nuclear Physics	12	10.00
e. Obshchie Voprosy Fiziki, Metody i Tekhnika Fizicheskogo Eksperimenta General Problems in Physics, Methods and Techniques for Physics Experiments	12	10.00
f. Radiofizika, Fizicheskie Osnovy Elektroniki, Akustika Radio physics, Physical Basis for Elec- tronics, Acoustics	12	12.00
g. Teoreticheskaya Fizika i Fizika Elementarnykh Chastits Theoretical Physics and Physics of Elementary Particles	12	9.00
9. Geofizika Geophysics	12	46.00
a. Fizika Zemli Earth Physics	12	4.00
b. Geomagnetizm i Vysokie Sloi Atmosfery Geomagnetism and Upper Layer Atmosphere	12	8.00
10. Geografia Geography	12	76.00
a. Antropogenovyi Period, Geomorfologiya Sushi i Morskogo Dna Anthropogenic Period, Geomorphology of Arids and Ocean Floor	12	8.00
b. Biogeografia Biogeography	12	8.00
c. Geografia Ameriki, Avstralii, Okeanii i Antarktiki Geography of America, Australia, Oceania and Antarctic	12	5.00
d. Geografia SSR Geography of USSR	12	5.00
e. Geografia Zarubezhnoi Azii i Afriki Geography of non-Soviet Asia and Africa	12	6.00
f. Geografia Zarubezhnoi Evropy Geography of non-Soviet Europe	12	9.00

g. Kartografiya Cartography	12	3.00
h. Meteorologiya i Klimatologiya Meteorology and Climatology	12	12.00
i. Okeanologiya, Gidrologiya Sushii, Glatsiologiya Oceanography, Hydrology of Arid Zones, Glaciers	12	10.00
j. Okhrana Prirody i Vospoizvodstvo Prirodnnykh Resursov, Kraevedeniye Conservation and Replenishment of Natural Resources. Knowledge of Countries	12	5.00
k. Teoreticheskie Voprosy Fizicheskoi i Ekonomicheskoi Geografii Theoretical Problems in Physical and Economic Geography	12	5.00
11. Geologiya Geology	12	84.00
a. Geokhimiya, Mineralogiya, Petrografiya Geochemistry, Mineralogy, Petrography	12	14.00
b. Geologicheskie i Geokhimitskie Metody Poleznykh Iskopaemykh, Metody Razvedki i Otsenka Mestorozhdenii, Razvedochnaya i Promyslovaia Geofizika Geological and Geochemical Methods for Mineral Resources. Prospecting and Mineral Evaluation Methods, Prospect- ing and Industrial Geophysics	12	8.00
c. Gidrogeologiya, Inzhenernaya Geologiya, Merzlotovedeniye Hydro and Engineering Geology, Permafrost	12	8.00
d. Mestorozhdeniya Goriuchikh Poleznykh Iskopaemykh Deposits of Useful Minerals	12	6.00
e. Nemetallicheskie Poleznye Iskopaemye Non-metallic Mineral Resources	12	3.00
f. Obshchaya Geologiya General Geology	12	10.00
g. Rudnye Mestorozhdeniya Mining Deposits	12	4.00
h. Stratigrafiya, Paleontologiya Stratigraphy, Paleontology	12	9.00
i. Tekhnika Geologo-Razvedochnykh Rabot Technique of Geologic Exploration	12	3.00
12. Gornoe Delo Mining	12	40.00
a. Obogashcheniye Poleznykh Iskopaemykh Dressing of Mineral Resources	12	5.00
b. Razrabotka Neftnykh i Gazovykh Mestorozhdenii Processing of Petroleum and Gas Deposits	12	9.00

c. Stroitel'stvo i Organizatsia Gornyykh Predpriyatiy Building and Organization of Mining Enterprises	12	4.00
d. Tekhnologiya Vspomogatel'nykh Protseessov Razrabotki Mestorozhdenii Tverdykh Poleznykh Iskopaemykh Technology of Ancillary Processes for Handling Hard Mineral Resources	12	5.00
e. Tekhnologiya Osnovnykh Protseessov Razrabotki Mestorozhdenii Tverdykh Iskopaemykh Technology of Basic Processes for Handling Hard Mineral Resources	12	12.00
13. Khimiya Chemistry	24	420.00
a. Analiticheskaya Khimiya, Oborudovanie Laboratorii Analytical Chemistry, Laboratory Equipment	24	18.00
b. Khimiya i Pererabotka Drevesiny, Goriuchikh Iskopaemykh i Prirodnykh Gazov Chemistry and Processing of Wood, Minerals, and Natural Gas	24	12.00
c. Khimiya i Tekhnologiya Vysokomolekuliarnykh Soedinenii Chemistry and Technology of High Molecular Weight Compounds	24	56.00
d. Khimiya i Tekhnologiya Pischevykh Produktov, Poverkhnostnoaktivnykh Materialov i Dushistykh, Veschestv Chemistry and Technology of Food Products, Surface Active Materials and Aromatic Substances	24	24.00
e. Korrozia i Zashchita Ot Korrozii Corrosion and Corrosion Protection	24	7.00
f. Obshchie Voprosy Khimii. Fizicheskaya Khimiya. Neorganicheskaya Khimiya General Problems of Chemistry. Physical Chemistry. Inorganic Chemistry	24	56.00
g. Obshchie Voprosy Khimicheskoi Tekhnologii General Problems of Chemical Technology	24	18.00
h. Organicheskaya Khimiya Organic Chemistry	24	72.00
i. Silikatnye Materialy Silicon Materials	24	12.00
j. Tekhnologiya Neorganicheskikh Veschestv Technology of Inorganic Substances	24	16.00
k. Tekhnologiya Organicheskikh Veschestv Technology of Organic Substances	24	34.00
14. Kibernetika Cybernetics	12	25.00
a. Teoriya Veroyatnostei i Matematicheskaya		

Statistika. Teoreticheskaya Kibernetika Probability Theory and Mathematical Statistics. Theoretical Cybernetics	12	12.00
b. Tekhnicheskaya Kibernetika Technical Cybernetics	12	10.00
15. Legkaya Promyshlennost Light Industry	12	19.00
a. Mashiny i Oborudovanie Dlia Tekstilnoi Promyshlennosti Machinery and Equipment for the Textile Industry	12	8.00
b. Tekhnologiya i Organizatsiya Tekstilnogo Proizvodstva Technology and Organization of the Textile Industry	12	4.00
c. Trikotazhnaya, Shveynaya i Kozhevenno- Obuvnaya Promyshlennost Knitting, Sewing, Leather and Footwear Industry	12	6.00
16. Matematika Mathematics	12	50.00
a. Matematicheskii Analiz Mathematical Analysis	12	16.00
b. Obshchie Voprosy Matematiki. Matematicheskaya Logika. Teoriya Chisel. Algebra. Topologiya Geometriya General Mathematics Problems. Mathemat- ical Logic. Theory of Numbers. Algebra. Topology. Geometry	12	12.00
c. Teoriya Veroyatnostei i Matematicheskaya Statistika. Teoreticheskaya Kibernetika Theory of Probability and Mathematical Statistics. Theoretical Cybernetics.	12	12.00
17. Mekhanika Mechanics	12	56.00
a. Gidromekhanika Hydromechanics	12	24.00
b. Mekhanika Tverdykh Deformiruemyykh Mechanics of the Deformation of Solids	12	16.00
c. Obshchie Voprosy Mekhaniki. Obshchaya Mekhanika General Problems of Mechanics. General Mechanics	12	4.00
18. Metallurgiya Metallurgy	12	57.00
a. Metallovedenie i Termicheskaya Obrabotka Metallurgy and Thermal Metal Working	12	19.00
b. Metallurgicheskaya Tepotekhnika, Kontrolno- Izmeritelnye Pribory i Avtomatizatsiya		

Metallurgicheskogo Proizvodstva	12	3.00
Metallurgical Thermo-Technology, Control and Automation of Metallurgical Production		
c. Metallurgiya Tsvetnykh i Redkikh Metallov	12	2.00
Metallurgy of Non-Ferrous and Rare Metals		
d. Proizvodstvo Chuguna i Stali	12	9.00
Production of Castings and Steel		
e. Prokatnoe i Volochilnoe Proizvodstvo	12	8.00
Rolling and Extrusion Processing		
f. Teoriya Metallurgicheskikh Processov	12	2.00
Theory of Metallurgical Processes		
g. Tekhnicheskii Analiz v Metallurgii	12	3.00
Technical Analysis in Metallurgy		
19. Promyshlennyy Transport	12	14.00
Industrial Transport		
a. Mekhanizatsiya i Avtomatizatsiya Pogruzochno-Razgruzochnykh Rabot Na Promyshlennom Transporte	12	3.00
Mechanization and Automation of Loading and Unloading in Industrial Transport		
b. Podiemno-Transportnoe Mashinostroyeniye	12	6.00
Hoisting-Transport Machine Construction		
c. Transportnoe Khozaystvo Promyshlennykh Predpriyatiy	12	3.00
Transport Economy for Industrial Enterprises		
20. Radiotekhnika	12	38.00
Radiotechnology		
a. Radiotekhnika (Antenny. Volnovody. Ob'emnye Rezonatory. Kvaziopticheskiye Ustroystva)	12	5.00
Radiotechnology (Antennas. Wave Resonators, Quasi-optical Instruments)		
b. Radiotekhnika (Priemniki. Usiliteli. Preobrazovateli Chastoty. Generatory. Peredatschie Ustroystva. Kvantovaya Radiotekhnika)	12	10.00
Radiotechnology (Receivers. Amplifiers. Transformer Elements. Transmitting Facilities. Quantum Radiotechnology)		
c. Radiotekhnika (Radioveshchanie. Elektroakustika. Zvukozapisi. Tekhnologiya Proizvodstva Apparatura)	12	8.00
Radiotechnology (Radio Broadcasting. Electroacoustics. Sound Recording. Technology of Apparatus Production)		
d. Radiotekhnika (Radiolokatsiya. Radionavigatsiya. Televidenie. Impulsnaya Tekhnika)	12	6.00
Radiotechnology (Radiolocation. Television. Impulse Technique)		
e. Radiotekhnika (Teoreticheskaya Radiotekhnika)		

Radiosv'iaz. Radiopremekhi. Radioizmereniia)	12	8.00
Radiotechnology (Theoretical Radiotechnology. Radio Communication. Radio Impedance. Radio Measurement)		
21. Tekhnologia Mashinostroeniia	12	55.00
Technology of Machine Construction		
a. Tekhnologia i Oborudovanie		
Derevobrabatyvalushchego Proizvodstva.		
Lesozagotovitel'noe Oborudovanie	12	8.00
Technology and Equipment of the Wood Work- ing Industry. Forestry Preparatory Equip- ment		
b. Tekhnologia i Oborudovanie Kuznechno		
Kuznechnoshlampovoch'nogo Proizvodstva	12	8.00
Technology and Equipment of the Forging and Stamping Industry		
c. Tekhnologia i Oborudovanie Liteinogo		
Proizvodstva	12	9.00
Technology and Equipment of the Foundry Industry		
d. Tekhnologia i Oborudovanie Mekhanosbornochnogo		
Proizvodstva	12	30.00
Technology and Equipment for Assembly-Line Production		
22. Teploenergetika	12	18.00
Thermo-energetics		
a. Atomnye Elektrostantsii	12	3.00
Nuclear Power Stations		
b. Kotelaye Ustanovki i Vodopodgotovka	12	4.00
Boiler Stations and Water Treatment		
c. Obshchie i Teoreticheskie Voprosy		
Teploenergetiki. Gelienergetika	12	3.00
General and Theoretical Problems of Thermo-energetics. Solar-energy		
d. Teploekhnicheskie Kharakteristiki Topliva.		
Ispol'zovanie Gaza i Mazuta v		
Promyshlennosti	12	3.00
Thermo-technological Characteristics of Fuel. Utilization of Gas and Fuel Oil in Industry		
e. Teplovye Elektrostantsii	12	6.00
Thermal Electrostations		
23. Vodnyi Transport	12	25.00
Water Transport		
a. Sudostroenie	12	12.00
Shipbuilding		
b. Tekhnicheskaya Eksploataatsia i Remont		
Flota, Sudovozhdenie	12	4.00
Technical Exploitation and Repair of the Fleet Ship		

c. Vodnye Perevozki Puti i Porty Water Travel, Waterways and Ports	12	6.00
24. Vozdushnyi Transport Air Transportation	12	14.00
a. Aviastroenie Airplane Construction	12	6.00
b. Organizatsia Vozdushnykh Perevozok i Oborudovanie Aeroportov Organization of Air Transport and the Out- fitting of Airports	12	4.00
c. Tekhnicheskaya Eksploatatsia i Remont Samoletov, Vertoletov i Drugikh Letatsinykh Apparatov Technical Maintenance and Repair of Air- planes, Helicopters, and other Flying Vehicles	12	3.00
25. Zheleznodorozhnyi Transport Railroad Transportation	12	20.00
a. Avtomatika, Telemekhanika i Sviaz Na Zheleznykh Dorogakh Automation, Telemechanics and Communi- cation on Railroads	12	3.00
b. Eksploatatsia Zheleznykh Dorog Railroad Utilization	12	3.00
c. Lokomotivostroenie i Vagonostroenie Locomotive and Railroad Car Construction	12	5.00
d. Stroitelstvo Zheleznykh Dorog. Put i Putevoi Khoziaistvo Railway Construction. Roads and Road Economy	12	4.00
e. Tekhnicheskaya Eksploatatsia Podvizhnogo Sostava i Tiaga Poezdov Technical Maintenance of Rolling Stock and Freight Trains	12	3.00

## Appendix B - Definitions

**Applied Research** - Research which represents investigation directed to discovery of new scientific knowledge and which has specific commercial objectives with respect to either products or processes.

**Basic Research** - Research which represents original investigation for the advancement of scientific knowledge and which does not have specific commercial objectives, although it may be in fields of present or potential interest to the investigating company.

**Company** - An organization consisting of one or more establishments under common ownership or control. This includes all establishments, subsidiaries, and affiliates.

**Depository** - An organization designated to receive, maintain, and make available to requesters all documents distributed by a particular source, e.g. Government Printing Office (GPO), Atomic Energy Commission (AEC), etc.

**Development** - Systematic use of scientific knowledge directed toward the production of useful materials, devices, systems or methods, including design and development of prototypes and processes.

**Educational Institutions** - Institutions of higher learning comprising the following: (1) colleges and universities proper, consisting of colleges of liberal arts, schools of arts and sciences, professional schools such as medicine and engineering, and affiliated research institutions, hospitals, and like organizations; (2) agricultural experiment stations and associated schools of agriculture; (3) Federal contract research centers administered by educational institutions.

**Expenditures** - Payments made during a given period, regardless of when the funds were appropriated.

**Gross National Product** - Total national output of goods and services at market prices. (GNP differs from "national income," mainly in that GNP includes allowances for depreciation and for indirect taxes, such as sales and excise taxes).

**Indicative Abstract** - Textual notation about document contents, sometimes using words from a controlled vocabulary that are also used for indexing. Does not summarize contents.

**Industrial Organizations** - Manufacturing and non-manufacturing companies, including commercial laboratories and engineering services, and Federal contract research centers administered by these firms.

**Informative Abstract** - Textual summary of document contents echoing the viewpoint of the document author, but sometimes including commentary by peer abstracter.

**National Income** - Aggregate of earnings by labor and property from the Nation's current production of goods and services. It is the sum represented by compensation of employees, proprietors' income, net interest, and corporate profits.

**Nonprofit Institutions** - Private philanthropic foundations, nonprofit research institutes, voluntary health agencies, professional societies, academies of science, museums, zoological gardens, botanical gardens, arboreta, and Federal contract research centers administered by nonprofit organizations.

**Nonrecipient** - An individual, company, or institution receiving none of the services of NSA, STAR, TAB, or USGRDR.

**Obligations** - Amounts for orders placed, contracts awarded, services received, and similar transactions during a given period, regardless of when the funds were appropriated and when future payment of money is required.

**Official Distribution** - Federal agency gratis distribution of NSA, STAR, TAB or USGRDR on the basis of the recipient's official connection with the respective authorizing agency.

**Personal Income** - Current income received by individuals by unincorporated businesses, and by nonprofit institutions from all sources net of personal contributions for social insurance.

**Proprietary Information** - Information to which some individual, company or institution has property rights.

**Recipient** - An individual, departmental unit, institution or industrial organization on the mailing list to receive one or more copies of any one of the abstracting and indexing services of NSA, STAR, TAB, or USGRDR.

**Research** - Systematic, intensive study directed toward fuller scientific knowledge of the subject studied. Such study covers both basic and applied research in the natural sciences, including medical sciences and engineering. It does not include design and development of prototypes and processes.

**Research and Development** - Basic and applied research in the sciences and engineering and the design and development of prototypes and processes.

**Scientists and Engineers** - Persons engaged in scientific and engineering work at a level requiring a knowledge of sciences equivalent at least to that acquired through completion of a 4-year college course.

site - Specific geographic location housing one or more buildings (usually having a common address) all reachable within easy walking distance from one another.

Users - Individuals, companies or institutions that can apply information in an abstract to their research work.

## 1. Recipient Questionnaire Cover Letter

School of Library Service

**Dear Sir:**

The questionnaire is designed to elicit information on user background and real use made of the abstracting and indexing services mailed to your organization. For the purposes of this study, we seek only information relating to the service(s) circled in red on the first page of the questionnaire. The primary user of the service should answer the questionnaire. If you are not the primary user, please forward this letter and questionnaire to the person who is the primary user. If addressed to a library or information center, the questionnaire should be completed by the librarian or information scientist most knowledgeable about the use made of the service.

We shall be most grateful if you will complete the enclosed questionnaire and return it in the self-addressed, stamped envelope. Negative responses are as significant as positive responses. Since most questions call for check-off answers, a minimum of your time (approximately ten minutes) will be required. Please feel assured that all data supplied will be kept in strict confidence. We seek your co-operation and earnestly hope that you will participate in this research effort.

Irving M. Klempner  
Principal Investigator

281

Appendix C

2. Recipient Questionnaire

Code \_\_\_\_\_ (1-7)

User Survey  
Abstracting and Indexing Services  
for Government-Sponsored Research

Instructions:

Please note the address on the cover letter. Copies of one or more of the following services are mailed to this address:

NSA	(Nuclear Science Abstracts)	1	(8)
STAR	(Scientific and Technical Aerospace Reports)	2	
TAB	(Technical Abstract Bulletin)	3	
USGRDR	(U. S. Government Research and Development Reports)	4	

For the purposes of this study, please confine your replies only to the service(s) circled in red above. The primary user of the service(s) should complete the questionnaire. If you are not the primary user of the circled service(s), please forward this letter and questionnaire to the person who is the primary user. If the service is addressed to and used by a library or information center, the librarian or information scientist most knowledgeable about the use made of the service should complete the questionnaire. Many thanks for your cooperation!

Part 1: Background Information

1. Which of the following best characterizes your primary activity? (If several, please check the activity to which you devote most time.)

- |   |                                 |      |
|---|---------------------------------|------|
| 1 | Research and Development        | (10) |
| 2 | Teaching--College or University |      |
| 3 | Graduate or Undergraduate study |      |
| 4 | Library or Information Service  |      |
| 5 | Technical Sales and Service     |      |
| 6 | Production and Operation        |      |
| 7 | Management and Administration   |      |

1 \_\_\_ Company or institution official (President, Vice-

- President, General Manager, Assistant General Manager) (11)
- 2 — Operations Manager (Works Manager, Superintendent, Assistant Works Manager, Assistant Superintendent)
- 3 — Research Director (Chief Engineer, Chief Chemist, Chief Metallurgist, Chief Physicist)
- 4 — Project Scientist or Engineer
- 5 — Foreman, Supervisor, Department Head
- 6 — Other management (Please specify) \_\_\_\_\_
- 10 X — Other (Please specify) \_\_\_\_\_

2. Which of the following best characterizes your subject specialty? (If several, please check the specialty to which you devote most time.) (12)

- 1 — Aeronautics
- 2 — Agriculture
- 3 — Astronomy and Astrophysics
- 4 — Atmospheric Sciences
- 5 — Behavioral and Social Sciences (includes Humanities)
- 6 — Biological and Medical Sciences
- 7 — Chemistry and Chemical Engineering
- 8 — Earth Sciences and Oceanography
- 9 — Electronics and Electrical Engineering
- 0 — Energy Conversion (non-propulsive)
- X — Engineering (Mechanical, Industrial, Civil, and Marine)
- Y — Library or Information Sciences (13)
- 1 — Materials and Metallurgy
- 2 — Mathematical Sciences
- 3 — Methods and Equipment
- 4 — Military Science
- 5 — Missile Technology
- 6 — Navigation, Communication, Detection, Countermeasures
- 7 — Nuclear Science and Technology
- 8 — Ordnance
- 9 — Physics
- 0 — Propulsion and Fuels
- X — Space Technology
- Y — Other (Please specify) \_\_\_\_\_

3. Are you personally engaged at present in carrying out any research and development (R&D)\* activity?

1 — Yes    2 — No (14)

4. If the answer to question No. 3 is "Yes," please estimate the percentage of time that you devote to R&D.

1 — Over 75% (15)

\* R&D activity is defined to include both basic and applied research in the sciences and engineering, and design and development of prototypes and processes.

- 2 ☐ 50%-74%
- 3 ☐ 20%-49%
- 4 ☐ 1%-19%

5. To the best of your knowledge, does your company\* or institution\* now have contracts for R&D with any of the following? (Please check all that apply.)

- 1 ☐ Atomic Energy Commission (AEC) (16)
- 2 ☐ Department of Defense (Army, Navy, Air Force) (DOD)
- 3 ☐ National Aeronautics and Space Administration (NASA)
- 4 ☐ Other Federal agency (Please specify) \_\_\_\_\_
- 5 ☐ None
- 6 ☐ Don't know

6. If you personally carry out R&D for any of the above agencies, please check those that apply:

- 1 ☐ AEC (17)
- 2 ☐ DOD
- 3 ☐ NASA
- 4 ☐ None
- 5 ☐ Other (Please specify) \_\_\_\_\_

7. Does your company or institution conduct in-house or internally sponsored research and development?

- 1 ☐ Yes 2 ☐ No (18)

8. Does your company or institution perform research and development for other private organizations and institutions?

- 1 ☐ Yes 2 ☐ No (19)

9. Were you an author, co-author, or editor of a technical report written within the last twelve months?

- 1 ☐ Yes 2 ☐ No (20)

10. Were you an author, co-author, or editor of a professional paper published in the journal literature within the last twelve months?

- 1 ☐ Yes 2 ☐ No (21)

11. Have you submitted a patent application within the last twelve months?

- 1 ☐ Yes 2 ☐ No (22)

12. Have any of the scientists or engineers (other than yourself) employed by your company or institution published any professional paper(s) in the journal literature within the last twelve months?

- 1 ☐ Yes 2 ☐ No 3 ☐ Don't know (23)

13. Have any of the scientists or engineers (other than yourself)

\* "Company" or "institution" is defined as an organization consisting of one or more establishments under common ownership or control. This includes all establishments, subsidiaries, and affiliates.

employed by your company or institution submitted patent applications within the last twelve months?

1 ☐ Yes 2 ☐ No 3 ☐ Don't know (24)

14. Please estimate the number of scientists and engineers (includes faculty members) currently employed in your:

1 Company or institution \_\_\_\_\_ (25)

2 Organizational unit, as addressed in cover letter \_\_\_\_\_

15. Does your company or institution maintain a library or information center?

1 ☐ Yes 2 ☐ No (26)

3 ☐ Other (Please specify) \_\_\_\_\_

16. Is the library or information center staffed by a professional librarian or information scientist?

1 ☐ Yes 2 ☐ No (27)

3 ☐ Other (Please specify) \_\_\_\_\_

17. Is the library or information center readily accessible to you?

1 ☐ Yes 2 ☐ No 3 ☐ Does not apply (28)

18. What is your highest earned degree?

Degree	Year Earned	Major
1 <input type="checkbox"/> B. A. /B. S. (30-31)	_____ (38)	_____ (39-41)
2 <input type="checkbox"/> M. A. /M. S. (32-33)	_____ (39)	_____
3 <input type="checkbox"/> Ph. D./D.Sc. (34-35)	_____ (40)	_____
4 <input type="checkbox"/> Other (36-37)	_____ (41)	_____
(Please specify) _____		

19. Why are the abstracting and indexing services sent to you?

	Service*			
	NSA	STAR	TAB	USGRDR
Don't know the reason	(42) <input type="checkbox"/> 1	(44) <input type="checkbox"/> 1	(46) <input type="checkbox"/> 1	(48) <input type="checkbox"/> 1 (42-49)

**Part II: Use Made of Abstracting and Indexing Services**

20. Have you yourself had any occasion within the last six months to make any use whatever of the abstracting and indexing service(s)?  
 1 \_\_\_ Yes      2 \_\_\_ No      (50)
21. If you have not personally made use of the service(s), has someone else made use of them for you?      (51)  
 1 \_\_\_ Yes      2 \_\_\_ No      3 \_\_\_ Does not apply

---

If the answer to questions 20 and 21 are "No," you may skip the rest of the questions. Any comments you may wish to make regarding the usefulness, relevance, or nonrelevance of the service(s) to your present activities will be carefully considered. (Use the space below for your comments, if any.)  
 Please mail the questionnaire in the enclosed envelope. Thank you very much.

---

22. If you answered "Yes" to question 21, what individual or office made use of the service(s) for you?      (9) (-2)
- 1 \_\_\_ Colleague  
 2 \_\_\_ Research Assistant  
 3 \_\_\_ Secretary  
 4 \_\_\_ Library  
 5 \_\_\_ Does not apply

6 Other (Please specify) \_\_\_\_\_

23. Generally, what do you use the service(s) for? (Please check all the reasons that apply and frequency of use.)

		Frequency of Use			
		Frequently	Occasionally	Rarely or never	
(10)	1 <u>To scan for specific information directly pertinent to your current project or research</u>	_____ 1	_____ 2	_____ 3	(11)
	2 <u>To keep abreast of current literature in your primary field of interest</u>	_____ 1	_____ 2	_____ 3	(12)
	3 <u>To keep abreast of current literature in your secondary field(s) of interest</u>	_____ 1	_____ 2	_____ 3	(13)
	4 <u>For quick retrospective reference or information retrieval</u>	_____ 1	_____ 2	_____ 3	(14)
	5 <u>For exhaustive literature searches</u>	_____ 1	_____ 2	_____ 3	(15)
	6 <u>For "browsing" in fields related or unrelated to your specialty</u>	_____ 1	_____ 2	_____ 3	(16)
	7 <u>Other (Please specify)</u>	_____ 1	_____ 2	_____ 3	(17)

24. If you checked more than one item in question 23, please record the numbers of the checked items in descending order of importance.

Item number:

_____ (18)	_____ (19)	_____ (20)	_____ (21)	_____ (22)	_____ (23)	_____ (24)	(18-24)
(Most important)						(Least important)	

25. When making use of abstracting and indexing service(s), do you generally look for: (Please check all that apply, and for each frequency of use and field scanned)

		Frequency of Use			Field Scanned	
		Frequently	Occasionally	Rarely or never	Own Field(s)	Related Field(s)
(25)	1 <u>Specific data or findings</u>	_____ 1	_____ 2	_____ 3	(26) _____ 1	_____ 2
	2 <u>Information relating to</u>					

Frequency of Use			Field Scanned	
Frequently	Occasionally	Rarely or never	Own Field(s)	Related Field(s)

laboratory  
methods, tech-  
niques, proced-  
ures, apparatus,  
etc.

(29) 1 2 3 (29) 1 2 (29-29)

3 Theoretical or  
conceptual  
statements or  
ideas

(30) 1 2 3 (31) 1 2 (30-31)

4 Reviews, state-  
of-the-art sur-  
veys

(32) 1 2 3 (33) 1 2 (32-33)

5 Other (Please  
specify)

(34) 1 2 3 (35) 1 2 (34-35)

26. When scanning an issue of the abstracting and indexing service, do you generally: (Please check all that apply)

- 1 ☐ Check the Table of Contents and scan exclusively the section relating to your primary field of interest (36)
- 2 ☐ Check the Table of Contents and scan the sections relating to your primary and secondary field(s) of interest
- 3 ☐ Scan exclusively secondary field(s) of interest
- 4 ☐ Scan or "browse" through whole issue
- 5 ☐ Use the indexes and look up specific items of interest
- 6 ☐ Other (Please specify) \_\_\_\_\_

27. The most recent use you made of the abstracting and indexing service(s) was for: (Please check the one that applies.)

- 1 ☐ Keeping abreast of newly published literature (37)
- 2 ☐ Information needed for the preparation of a report
- 3 ☐ Information needed for the preparation of a lecture
- 4 ☐ Information needed for the preparation of a proposal
- 5 ☐ Information needed for project experiment
- 6 ☐ Retrospective literature search
- 7 ☐ General "browsing"
- 8 ☐ Other (Please specify) \_\_\_\_\_

28. After seeing an item of interest in the abstracting and indexing service(s), do you usually: (Please check all that apply and for each, whether of immediate or long-term value.)

If of im- mediate use or value	If not of im- mediate use or value
--------------------------------------	--

(38) 1 ☐ Make a mental note of its

- contents only \_\_\_\_\_ 1 \_\_\_\_\_ 2 (39)  
 2 Make or have made a written \_\_\_\_\_ 1 \_\_\_\_\_ 2 (40)  
   note of its contents \_\_\_\_\_ 1 \_\_\_\_\_ 2 (40)  
 3 Seek to obtain original and, \_\_\_\_\_ 1 \_\_\_\_\_ 2 (41)  
   if obtained, read it as soon \_\_\_\_\_ 1 \_\_\_\_\_ 2 (41)  
   as possible \_\_\_\_\_ 1 \_\_\_\_\_ 2 (41)  
 4 Seek to obtain original, and \_\_\_\_\_ 1 \_\_\_\_\_ 2 (42)  
   if obtained, have it filed for \_\_\_\_\_ 1 \_\_\_\_\_ 2 (42)  
   future use (without reading) \_\_\_\_\_ 1 \_\_\_\_\_ 2 (42)  
 5 Other (please specify) \_\_\_\_\_ 1 \_\_\_\_\_ 2 (43)

29. If desired, how difficult is it for you to acquire the original or photocopy of the item cited in the abstracting and indexing service?

- 1 Very difficult  
 2 Rather difficult  
 3 Rather easy

30. For the indexes listed below, please indicate how useful each is in your work.

	Very useful	Rather useful	Occa- sionally useful	Of little or no use	
Personal Author Index	1	2	3	4	(45)
Corporate Author Index	1	2	3	4	(46)
Subject Index	1	2	3	4	(47)
Report Number Index	1	2	3	4	(48)
Contract Number Index	1	2	3	4	(49)

31. For the indexes listed below, please check the frequency with which you have used each within the last six months.

	Frequency of Use					
	Daily	Weekly	Monthly	Rarely	Never	
Personal Author Index	1	2	3	4	5	(50)
Corporate Author Index	1	2	3	4	5	(51)
Subject Index	1	2	3	4	5	(52)
Report Number Index	1	2	3	4	5	(53)
Contract Number Index	1	2	3	4	5	(54)

32. Within the last twelve months, have you had to undertake a line of research that was definitely outside the field of your specialization?

- 1 Yes 2 No (55)

33. Within the last twelve months, have you had a need for data, techniques, processes, equipment, etc. from outside the field of your specialization?

- 1 Yes 2 No (56)

34. Please estimate the time that you personally devote on the average to scanning a single issue of the abstracting and indexing service:

	Service*				
	(57) NSA	(58) STAR	(59) TAB	(60) USGRDR	(57-60)
Less than 5 minutes	<u>1</u>	<u>1</u>	<u>1</u>	<u>1</u>	
5-14 minutes	<u>2</u>	<u>2</u>	<u>2</u>	<u>2</u>	
15-29 minutes	<u>3</u>	<u>3</u>	<u>3</u>	<u>3</u>	
30-44 minutes	<u>4</u>	<u>4</u>	<u>4</u>	<u>4</u>	
45-59 minutes	<u>5</u>	<u>5</u>	<u>5</u>	<u>5</u>	
60-120 minutes	<u>6</u>	<u>6</u>	<u>6</u>	<u>6</u>	
More than 2 hours	<u>7</u>	<u>7</u>	<u>7</u>	<u>7</u>	

35. After scanning an issue of the abstracting and indexing service, what do you do with it? (Please check the one that applies best.)

	Service*				
	(8) NSA	(9) STAR	(10) TAB	(11) USGRDR	(8-11)
<u>File and keep last 5 years or longer</u>	<u>1</u>	<u>1</u>	<u>1</u>	<u>1</u>	(-3)
<u>File and keep 3-4 years</u>	<u>2</u>	<u>2</u>	<u>2</u>	<u>2</u>	
<u>File and keep 1-2 years</u>	<u>3</u>	<u>3</u>	<u>3</u>	<u>3</u>	
<u>Keep current issues only</u>	<u>4</u>	<u>4</u>	<u>4</u>	<u>4</u>	
<u>Discard immediately after scanning</u>	<u>5</u>	<u>5</u>	<u>5</u>	<u>5</u>	
<u>Clip or note issue and discard</u>	<u>6</u>	<u>6</u>	<u>6</u>	<u>6</u>	
<u>Route issue directly to library</u>	<u>7</u>	<u>7</u>	<u>7</u>	<u>7</u>	
<u>Route to other individuals on routing slip</u>	<u>8</u>	<u>8</u>	<u>8</u>	<u>8</u>	
<u>Other (Please specify)</u>	<u>9</u>	<u>9</u>	<u>9</u>	<u>9</u>	

36. Do you maintain a personal file of citations pertinent to your subject specialty?

1 Yes 2 No (12)

37. For the services listed below, please check the titles used and frequency of your use, if any, within the last six months.

		Frequency of Use				
		Daily	Weekly	Monthly	Occa- sionally	Never
(13)	1 Nuclear Science Abstracts	1	2	3	4	5 (14)
	2 Scientific & Technical Aerospace Reports	1	2	3	4	5 (15)
	3 Technical Abstract Bulletin	1	2	3	4	5 (16)
	4 U. S. Government Research & Development Reports	1	2	3	4	5 (17)
	5 Applied Mechanics Reviews	1	2	3	4	5 (18)
	6 Biological Abstracts	1	2	3	4	5 (19)
	7 Chemical Abstracts	1	2	3	4	5 (20)
	8 Electrical Engineering Abstracts	1	2	3	4	5 (21)
	9 Engineering Index	1	2	3	4	5 (22)
	0 Index Medicus	1	2	3	4	5 (23)
	X Physics Abstracts	1	2	3	4	5 (24)
	Y Other (Please spec.)	1	2	3	4	5 (25)

38. If your issue of the abstracting and indexing service is routed or seen by others in your immediate group, please estimate the number of individuals who are on the routing list or that make use of your issue:

	Service *			
	NSA	S. AR	TAB	USGRDR
Number on routing list	(26-27)	(31-32)	(36-37)	(42-42) (28-45)
Number that make use of issue in your immediate group	(28-29)	(33-34)	(38-39)	(43-44)
Does not apply	(50-1)	(35-1)	(40-1)	(45-1)
Other (Please specify)	(30-2)	(35-2)	(40-2)	(45-2)

39. As a recipient of one of the Federal abstracting and indexing services, would you be interested in getting information about any of the following? (Please check all that apply.)

NSA—Nuclear Science Abstracts, STAR—Scientific & Technical Aerospace Reports, TAB—Technical Abstract Bulletin, USGRDR—U. S. Government Research & Development Reports

- 1      Nuclear Science Abstracts (issued by the U. S. Atomic Energy Commission) (46)
  - 2      Scientific and Technical Aerospace Reports (issued by the National Aeronautics and Space Administration)
  - 3      Technical Abstract Bulletin (issued by the Defense Documentation Center, U. S. Department of Defense)
  - 4      U. S. Government Research & Development Reports (issued by the Clearinghouse for Federal Scientific and Technical Information, U. S. Department of Commerce)
  - 5      None desired
40. Given a choice, and in lieu of the present contents found in the abstracting service(s) mailed to you, would you prefer to receive abstracts of reports covering subjects that are:
- 1      Exclusively from within your own subject specialty? (47)
  - 2      Within the broad primary field encompassing your subject specialty?
  - 3      Covering exclusively secondary fields, i. e., excluding subject specialty?
  - 4      Covering selected developments, ideas, techniques, etc. from all fields applicable to your subject specialty?
  - 5      Prefer present format as is
  - 6      Other (Please specify) \_\_\_\_\_

(48)

If you are a member of a library or information service staff, kindly complete questions 41-50. If you are not a member of a library or information service staff, please check here and then return the questionnaire in the enclosed self-addressed envelope. Thank you very much.

41. Which of the following does the library or information center perform? (Please check all that apply.)
- 1      Catalogs technical reports (49)
  - 2      Selectively disseminates incoming technical reports
  - 3      Prepares abstracts for newly acquired technical reports
  - 4      Selectively disseminates abstracts
  - 5      Issues acquisitions or announcement bulletin
  - 6      Other technical report service: (Please specify) \_\_\_\_\_
42. If your library issues an acquisitions or announcement bulletin, its frequency is:
- 1      Daily    2      Weekly    3      Biweekly    4      Monthly (50)
  - 5      Other (Please specify) \_\_\_\_\_
43. Technical reports are cataloged because: (Please check all that apply.)

- 1 More detailed subject approach is needed than that provided in the abstracting and indexing services (51)
  - 2 Subject approach is adequate, but indexes are issued too late
  - 3 The only reports cataloged are those not listed in the services
  - 4 Descriptive cataloging inadequate
  - 5 Does not apply
  - 6 Other (Please specify) \_\_\_\_\_
44. In descriptive cataloging of reports, entries are prepared for: (Please check all that apply.)
- 1 Personal authors (52)
  - 2 Corporate authors
  - 3 Report number
    - 1 Issuing agency (53)
    - 2 Monitoring agency
    - 3 AD, PB, TID, etc. documentation center accession number
  - 4 Contract number (52)
  - 5 Project number
  - 6 Does not apply
  - 7 Other (Please specify) \_\_\_\_\_
45. In subject analyses of technical reports, your library or information center uses on the average:
- 1 1-2 subjects/descriptors/uniterms, etc. per report (54)
  - 2 3-4 subjects/descriptors/uniterms, etc. per report
  - 3 5-6 subjects/descriptors/uniterms, etc. per report
  - 4 7-9 subjects/descriptors/uniterms, etc. per report
  - 5 10-15 subjects/descriptors/uniterms, etc. per report
  - 6 Over 15 subjects/descriptors/uniterms, etc. per report
  - 7 Does not apply
46. What is the total number of full-time employees in your library or information center?
- 1 Professional (Full time equivalent) \_\_\_\_\_ (55-57)
  - 2 Clerical and Sub-professional (Full time equivalent) \_\_\_\_\_
  - 3 Don't know
47. Please estimate the total (i.e., potential) library or information center clientele to be serviced by your library or information center:
- 1 Total scientists and engineers \_\_\_\_\_ (58-60)
  - 2 Other Professional/Managerial \_\_\_\_\_

3 Technical and supporting personnel \_\_\_\_\_  
 4 \_\_\_ Don't know

48. Please estimate the number of technical reports held by your library or information center. (Consider titles only. Include micro-reproductions in title estimate.)

1. Total number of technical report titles \_\_\_\_\_ (61-62)  
 2. \_\_\_ Don't know

49. Of the total number of technical report titles held in your library or information service, please estimate the percentage of:

1 \_\_\_ % DOD reports (63-70)  
 2 \_\_\_ % AEC reports  
 3 \_\_\_ % NASA reports  
 4 \_\_\_ % Other  
 100% Total

50. For each of the services listed below, please indicate the number of copies received by your library or information center, whether circulation or routing is permitted, and distribution or disposition of copies received.

	Service*			
	NSA	STAR	TAB	USGRDR
Copies Received				
Total number	___ (11-12)	___ (27-28)	___ (43-44)	___ (60-61)
Circulation or Routing				(11) (-4)
Permitted	___ (13)	___ (29)	___ (44-45)	___ (62-63)
Not permitted	___ (14)	___ (30)	___ (46-47)	___ (64-65)
Distribution or Disposition				
Reference	___ (15-16)	___ (31-32)	___ (48-49)	___ (66-67)
Acquisitions	___ (17-18)	___ (33-34)	___ (50-51)	___ (68-69)
Circulation	___ (19-20)	___ (35-36)	___ (52-53)	___ (70-71)
Sub-libraries	___ (21-22)	___ (37-38)	___ (54-55)	___ (72-73)
Routing	___ (23-24)	___ (39-40)	___ (56-57)	___ (74-75)
Other (Please spec.)	___ (25-26)	___ (41-42)	___ (58-59)	___ (76-77)

Please feel free to make additional comments relating to any phase of this questionnaire. Your comments and suggestions will be given careful consideration. Kindly mail the questionnaire in the enclosed self-addressed, stamped envelope. Thank you very much. Your cooperation is greatly appreciated.

Appendix D

i. Nonrecipient Questionnaire Cover Letter

Columbia University in the City of New York - New York, N. Y. 10027  
School of Library Service  
Butler Library

Dear Sir:

You are no doubt aware of the considerable sums of money that the Federal Government spends annually on research and development activity. The research results stemming from these expenditures are frequently made available to industry and educational institutions in the form of technical reports.

The Directorate of Information Sciences, U. S. Air Force Office of Scientific Research, under contract AF 49(638) 1741, is supporting a study carried out at the Columbia University School of Library Service, aimed at discovering more effective means for disseminating and utilizing the technical reports literature.

The enclosed questionnaire is designed to elicit information regarding your organization's familiarity with certain federally published abstracting and indexing services which announce the existence and availability of technical reports derived from government-sponsored research. The information supplied to us in the questionnaire will be interpreted in the light of the background and over-all information needs of the respondents.

Though research-oriented and having a capability to perform research and development tasks for Federal agencies, it is quite likely that your firm or institution does not now receive any of the abstracting and indexing services referred to in the questionnaire. Negative responses are as significant as positive responses. Please feel assured that all data supplied will be kept in strict confidence.

The efficient transfer of scientific and technical information from defense-oriented industries and institutions to the broader, private sector of our economy is of vital interest to the business community and the Federal Government. We seek your cooperation in completing the enclosed questionnaire. A self-addressed return envelope is enclosed for your convenience. We hope that you will participate in this research effort.

Very truly yours,

Irving M. Klempner  
Principal Investigator

2. Nonrecipient Questionnaire

Code \_\_\_\_\_ (1-7)

Abstracting and Indexing Services  
for Government-Sponsored Research

Instructions:

For the purposes of this study, this questionnaire should be completed by the individual concerned with the acquisition and dissemination of scientific and technical information needed by your organization in support of research and development activity.

Many thanks for your cooperation.

\_\_\_\_\_  
Name of person completing questionnaire Title (8)

\_\_\_\_\_  
Name of employer

\_\_\_\_\_  
Department or sub-unit

\_\_\_\_\_  
Address

Part 1: Background Information

1. Which of the following best characterizes your company's\* or institution's\* field of specialization? (If several, please check the field to which the major portion of staff time is devoted.)

- 1 \_\_\_ Aeronautics (9)
- 2 \_\_\_ Agriculture
- 3 \_\_\_ Astronomy and Astrophysics
- 4 \_\_\_ Atmospheric Sciences
- 5 \_\_\_ Behavioral and Social Sciences (includes Humanities)
- 6 \_\_\_ Biological and Medical Sciences
- 7 \_\_\_ Chemistry and Chemical Engineering
- 8 \_\_\_ Earth Sciences and Oceanography
- 9 \_\_\_ Electronics and Electrical Engineering
- 0 \_\_\_ Energy Conversion (non-propulsive)
- X \_\_\_ Engineering (Mechanical, Industrial, Civil, and Marine)
- Y \_\_\_ Library or Information Sciences

\* "Company" or "institution" is defined as an organization consisting of one or more establishments under common ownership or control. This includes all establishments, subsidiaries, and affiliates.

- 1 ☐ Materials and Metallurgy (10)
- 2 ☐ Mathematical Sciences
- 3 ☐ Methods and Equipment
- 4 ☐ Military Science
- 5 ☐ Missile Technology
- 6 ☐ Navigation, Communication, Detection, Countermeasures
- 7 ☐ Nuclear Science and Technology
- 8 ☐ Ordnance
- 9 ☐ Physics
- 0 ☐ Propulsion and Fuels
- X ☐ Space Technology
- Y ☐ Other (Please specify) \_\_\_\_\_
2. Does your company or institution conduct in-house or internally sponsored research and development (R&D)\*\*? (11)
- 1 ☐ Yes 2 ☐ No
3. Does your company or institution perform R&D for other private organizations and institutions? (12)
- 1 ☐ Yes 2 ☐ No
4. To the best of your knowledge, does your company or institution now have contracts for R&D with any of the following? (Please check all that apply.) (13)
- 1 ☐ Atomic Energy Commission (AEC)
- 2 ☐ Department of Defense (Army, Navy, Air Force) (DOD)
- 3 ☐ National Aeronautics and Space Administration (NASA)
- 4 ☐ Don't know
- 5 ☐ None
- 6 ☐ Other Federal agency (Please specify) \_\_\_\_\_
5. Please estimate the number of scientists and engineers (including faculty members) currently employed in your company or institution. (14)
- 1 ☐ 1-9 3 ☐ 20-49 5 ☐ 100-199 7 ☐ 300-499
- 2 ☐ 10-19 4 ☐ 50-99 6 ☐ 200-299 8 ☐ Over 500
6. Please estimate the percentage of total staff time devoted to R&D. (15)
- 1 ☐ Over 75% 2 ☐ 50%-74% 3 ☐ 20%-49% 4 ☐ 1%-19%
- \*\* R&D activity includes both basic and applied research in the sciences and engineering, and the design and development of prototypes and processes.

7. Does your company or institution maintain a library or information center?

1    Yes                      2    No    (16)

3    Other (Please specify) \_\_\_\_\_

8. If so, is the library or information center staffed by a professional librarian or information scientist?

1    Yes                      2    No                      3    Does not apply    (17)

4    Other (Please specify) \_\_\_\_\_

9. Is the library or information center readily accessible to you?

1    Yes                      2    No                      3    Does not apply    (18)

10. In general, is it your opinion that the scientific and technical information needs of your company or institution are being met?

1    Fairly well    (19)

2    Well

3    Very Well

4    Excellently

5    Inadequately

#### Part 11: Use Made of Abstracting and Indexing Services

11. Are you personally acquainted with any of the abstracting and indexing services, NSA, STAR, TAB, USGRDR\*?

Service*	Acquainted		
	Yes	No	
NSA	_____	_____	
STAR	_____ 1	_____ 2	(20)
TAB	_____ 1	_____ 2	(21)
USGRDR	_____ 1	_____ 2	(22)

12. If acquainted, have you had any occasion within the last six months to make any use whatever of these abstracting and indexing services?

1    Yes                      2    No                      3    Does not apply    (23)

13. If you have not personally made use of the service(s), has someone else made use of them for you?

1    Yes                      2    No                      3    Does not apply    (24)

\* NSA—Nuclear Science Abstracts

STAR—Scientific & Technical Aerospace Reports

TAB—Technical Abstract Bulletin

USGRDR—U. S. Government Research and Development Reports

14. If you answered "Yes" to question 13, what individual or office made use of the service(s) for you?

- 1    Colleague (25)  
 2    Research Assistant  
 3    Secretary  
 4    Library  
 5    Does not apply  
 6    Other (Please specify) \_\_\_\_\_

15. To the best of your knowledge, does your company or institution currently receive any of the following services?

Service	Received			
	Yes	No	Don't know	
(26) 1 <u>  </u> Nuclear Science Abstracts	<u>  </u> 1	<u>  </u> 2	<u>  </u> 3	(27)
2 <u>  </u> Scientific and Technical Aerospace Reports	<u>  </u> 1	<u>  </u> 2	<u>  </u> 3	(28)
3 <u>  </u> Technical Abstract Bulletin	<u>  </u> 1	<u>  </u> 2	<u>  </u> 3	(29)
4 <u>  </u> U. S. Government Research & Development Reports	<u>  </u> 1	<u>  </u> 2	<u>  </u> 3	(30)
5 <u>  </u> Applied Mechanics Reviews	<u>  </u> 1	<u>  </u> 2	<u>  </u> 3	(31)
6 <u>  </u> Biological Abstracts	<u>  </u> 1	<u>  </u> 2	<u>  </u> 3	(32)
7 <u>  </u> Chemical Abstracts	<u>  </u> 1	<u>  </u> 2	<u>  </u> 3	(33)
8 <u>  </u> Electrical Engineering Abstracts	<u>  </u> 1	<u>  </u> 2	<u>  </u> 3	(34)
9 <u>  </u> Engineering Index	<u>  </u> 1	<u>  </u> 2	<u>  </u> 3	(35)
0 <u>  </u> Index Medicus	<u>  </u> 1	<u>  </u> 2	<u>  </u> 3	(36)
X <u>  </u> Physics Abstracts	<u>  </u> 1	<u>  </u> 2	<u>  </u> 3	(37)
Y <u>  </u> Other (Please specify)	<u>  </u> 1	<u>  </u> 2	<u>  </u> 3	(38)

16. Would you be interested in getting information about any of the following? (Please check all that apply.)

- 1    Nuclear Science Abstracts (issued by the U. S. Atomic Energy Commission) (39)  
 2    Scientific and Technical Aerospace Reports (issued by the National Aeronautics and Space Administration)  
 3    Technical Abstract Bulletin (issued by the Defense Documentation Center, U. S. Department of Defense)  
 4    U. S. Government Research & Development Reports (issued by the Clearinghouse for Federal Scientific and Technical Information, U. S. Department of Commerce)

17. Within the last twelve months, have you or your company had to undertake a line of research that was definitely outside the field of your specialization?

1    Yes                      2    No (40)

18. Within the last twelve months, have you or your company had a need for data, techniques, processes, equipment, etc. from outside the field of your specialization?

1    Yes                      2    No (41)

19. When seeking information, do you generally look for: (Please check those that apply, frequency of use, and field scanned.)

	Frequency of Use			Field Scanned	
	Frc- quently	Occa- sionally	Rarely or Never	Own Field(s)	Related Field(s)
(42) 1 <u>  </u> Specific data or findings	(43) <u>  </u> 1	<u>  </u> 2	<u>  </u> 3	(44) <u>  </u> 1	<u>  </u> 2 (43-44)
2 <u>  </u> Information relating to laboratory techniques, procedures, apparatus, etc.	(45) <u>  </u> 1	<u>  </u> 2	<u>  </u> 3	(46) <u>  </u> 1	<u>  </u> 2 (45-46)
3 <u>  </u> Theoretical or conceptual statements or ideas	(47) <u>  </u> 1	<u>  </u> 2	<u>  </u> 3	(48) <u>  </u> 1	<u>  </u> 2 (47-48)
4 <u>  </u> Reviews, state-of-the-art surveys	(49) <u>  </u> 1	<u>  </u> 2	<u>  </u> 3	(50) <u>  </u> 1	<u>  </u> 2 (49-50)
5 <u>  </u> Other (Please specify)	(51) <u>  </u> 1	<u>  </u> 2	<u>  </u> 3	(52) <u>  </u> 1	<u>  </u> 2 (51-52)

20. Would you prefer to receive an abstracting and indexing service covering subjects that are:

- 1    Exclusively within your own subject specialty? (53)  
 2    Within the broad primary field encompassing your subject specialty?  
 3    Covering exclusively secondary fields, i. e., excluding subject specialty?  
 4    Covering selected developments, ideas, techniques, etc. from other fields applicable to your subject specialty?  
 5    Prefer format as is  
 6    Other (Please specify) \_\_\_\_\_

21. In making use of published materials, do you generally use these materials: (Please check those that apply and frequency of use.)

Frequency of Use			
	Fre- quently	Occa- sionally	Rarely or never
(54) 1 To scan for specific information directly pertinent to your current project or research	___ 1	___ 2	___ 3 (55)
2 To keep abreast of current literature in your primary field of interest	___ 1	___ 2	___ 3 (56)
3 To keep abreast of current literature in secondary field(s) of interest	___ 1	___ 2	___ 3 (57)
4 For quick retrospective reference or information retrieval	___ 1	___ 2	___ 3 (58)
5 For exhaustive literature searches	___ 1	___ 2	___ 3 (59)
6 For "browsing" in fields related or unrelated to your specialty	___ 1	___ 2	___ 3 (60)
7 Other (Please specify)	___ 1	___ 2	___ 3 (61)

22. If you checked more than one item in question 21, please record the numbers of the checked items in descending order of importance.

Item number:

___ (62)	___ (63)	___ (64)	___ (65)	___ (66)	___ (67)	___ (68)	(62-68)
Most im- portant			Least important				

Please feel free to make additional comments relating to any question posed in the questionnaire. Of particular interest would be comments relating to your successes or failures in obtaining needed information. Your comments and suggestions will be welcome and will be given careful consideration.  
Please mail the questionnaire in the enclosed return envelope.  
Thank you very much. Your cooperation is greatly appreciated.

# Subject Index

- ASM Review of Metal Literature, 52
- Abstracting and indexing services, as diffusion media, 50-75; attention-line distribution, 96-98, 257; combination distribution, 95-96, copy distribution, 90-92, 242-243, 246, 260-263, 270-273; evaluation, 51-52; foreign distribution, 79-80, 100-101, 266-273; frequency of use, 128-132, 134, 140; geographic distribution, 88-90, 94-96, 228-243, 261-265, 274-277; growth estimates, 50-52; in relation to other variables, 186-189; subject field distribution, 83, 85-88, 92-94, 219-227, 246, 257, 276-277; use by nonrecipient population, 173-176, 180; use by recipient population, 124-132
- Acquisitions bulletins, 148-150
- Agricultural extension services, 44
- Analytical Abstracts, 52
- Applied Mechanics Reviews, 52, 128, 180
- Applied research, 34
- Attention-line distribution, 96-98, 257
- Basic research, 34
- Biological Abstracts, 52, 128, 180
- COSATI subject field distribution, 83, 85-88, 219-227, 246, 257
- Capital, human, effect on productivity, 32-33
- Chemical Abstracts, 52, 125, 128, 141, 180
- Citation file maintenance, 116, 118
- Colleges and universities R & D funds, 202-203
- Contract number index, 134, 139-140
- Copy distribution, 90-92, 242-243, 246, 260-263, 270-273
- Corporate author index, 134, 139-140
- Corporate R & D projections, 204-206
- Czechoslovakia, 56-57, 206
- DOD User Survey, 23
- Distribution, by attention-line, 96-98, by COSATI subject field, 83, 85-88, 219-227; by site, 94-96; by state and region, 88-93
- Domestic recipients (see Non-Federal U.S. recipients, Federal recipients, GPO Depository Library recipients)
- Economic growth, and technical progress, 32-33
- Education, effect on productivity, 32-33; of recipient population, 116, 119
- Educational/nonprofit recipients, 82-84; by service and state, 238-239; R & D fund sources, 202-203
- Ekspress Informatsiia, 63, 68
- Electrical Engineering Abstracts, 52, 128, 180
- Engineering Index, 52, 129, 180
- Exchange distribution, 79
- Fast Announcement Service, 25
- Federal recipients, 80, 99, 259-263
- Federally-sponsored R & D, 37-41, 113, 115, 122-123, 200-201
- Foreign recipients, 79-80, 100-101, 266-273
- Frequency of use, abstracting and indexing services, 128-132, indexes to abstracts, 134
- GPO Depository Libraries, 80, 99-100, 263; distribution lists, 78-79; services received, 264-265
- Geographic distribution, 88-90,

- 228-243, 261-262, 264-265, 274-277
- Germany, East, 58-59
- Gross National Product, 32, 35-37, 39-40, 42-43
- Growth Industries, 33, 93
- Human capital (see Capital, human)
- Hungary, 57-58
- Index Medicus, 25, 129, 180
- Indexes to abstracts, frequency of use, 134, 140
- Industrial recipients, 82-84; by SIC classification, 92-94, 247-255; by service and state, 236-237, 276-277
- Industrial R & D, 41, 122, 256, and rate of return, 34, 199, sources of funds, 202-203
- Industrial Research Laboratories of the United States, 26-27, 162-163, 182
- Information, as economic resource, 32-49; as innovation factor, 43-44; dissemination inadequacy, 21, 192; needs of nonrecipients, 171, 175-179; needs of recipients, 116, 118, 130, 134-136
- Information centers (see Library and information centers)
- Information transfer, 21, 32-49, 188-189; factors inhibiting, 45-46, 189, Soviet policies, 59
- Innovations, recipient population record, 118-119, 121; time lag in application, 43-45
- International Aerospace Abstracts, 25, 52
- Inventions, and R & D, 33-34
- Journal des Savants, 50
- Keyword indexes, 23, 51
- Labor force, geographic distribution, 230-231
- Library and information centers, 141-143, 151-157, 172-173
- List of Small Business Concerns Interested in Performing Research and Development, 27, 162, 164
- Manufacturing industries, percentage shares in total output, 197, R & D and rate of return, 199; R & D as proportion of net output and sales, 198; service recipients, 82-84, 92-94, 236-237, 247-255, 276-277
- Military recipients, 261-262
- Monthly Catalog of United States Government Publications, 45
- NSA (see Nuclear Science Abstracts)
- National Defense Education Act, 190
- Non-Federal U.S. recipients, by attention-line distribution, 257; by COSATI subject field, 219-227, 257; by geographic region, 240-241; by service, 226-227, 234-235; by state, 228, 232-235; by type of institution, 223-225, 232-233
- Nonprofit institutions (see Educational/nonprofit institutions)
- Nonrecipient organizations, 167-172; Federal agency contracting, 170; information needs outside field of specialization, 171; internally-sponsored R & D, 170; library and information centers, 172; R & D for private industry, 170; R & D outside field of specialization, 171; scientists and engineers employed, 169; staff time devoted to R & D, 171; subject field specialization, 169
- Nonrecipient population, 162-182
- Nonrecipient Questionnaire, 27, 107, 165, 276-277, 295-301; respondent acquaintance with services, 173; adequacy of information services, 173; broad institutional groupings, 166; fields scanned for needed information, 179; frequency of reasons for using published materials, 176; interest in obtaining services, 174; preferences for subject scope coverage, 175; primary activity, 167; receipt of selected abstracting and indexing services, 180; types of information needs, 178; use made of published materials, 177; use made of services, 174
- Nuclear Science Abstracts (NSA),

- 21, 52; diffusion pattern, 76-106, 226-227, 234-239; 242-246, 259-273 (see also specific headings)
- Official distribution, 77-80
- Patent applications, 119-121, 124
- Personal author indexes, 134, 135-140
- Physics Abstracts, 52, 115, 180
- Poland, 54-56
- Potential recipients, 183-184
- Prehled technicke a hospodarake literatury, 57, 306
- Private recipients, 83-84
- Productivity and R & D, 32-33
- Psychological Abstracts, 52
- Publishing record, 118-124
- Purposeful dissemination, inhibiting factors, 189; need for, 188-189
- R & D (see Research and development)
- Recipient organizations, 120-157; definition, 105; Federally-sponsored R & D, 122-123; internally-sponsored R & D, 122; library and information center functions, 141, 147-157; publishing and innovation record, 118-124; scientists and engineers employed, 121
- Recipient population, 79-80, 107-160; approaches to services, 134, 137-138; citation file maintenance, 116, 118; document acquisition, 144; educational background, 116, 119; information needs, 116, 118, 130, 134; most recent use made of abstracting and indexing services, 130, 133; professional library services, 143; publishing and innovation record, 118-119; R & D conducted outside field of specialization, 118; reasons for use of abstracting and indexing services, 130-132; subject specialties, 116-117; uses made of services, 124-125
- Recipient Questionnaire, 27, 107-112, 281-294; respondent distribution, by state, 274-275; employment, 112; frequency of need of information types, 136; frequency of use of indexes to services, 140; frequency of use of services, 128-129; individual recipient characteristics, 112; interest in obtaining information about services, 146; library or information center accessibility, 143; preferences for subject scope coverage, 141-142; primary activity, 112, 114; retention of services, 144-145; subject specialization, 115-116; time devoted to scanning of services, 126; types of information or data sought, 135; usefulness of service indexes, 139
- Recipient types, 185-186
- Referativnyi Zhurnal, 60-63, 141, 207-218; abstract coverage, 52, 61-62; evaluation of, 67; foreign distribution, 66-67, growth of, 60-62; internal distribution and use, 63-66; publication time lag, 68; series and subseries, 141, 207-218
- Regional distribution, 240-241
- Report number indexes, 134, 139-140
- Research and development, and Federal budget, 43; and Gross National Product, 35-37, 39-40, 42-43; as percentage of net output, manufacturing industries, 198; as percentage of output and sales, manufacturing industries, 198; contracts by state, 229-230; corporate projections, 204-206; definition, 34; effect on inventions, 33-34; effect on Federal government, 113, 115, 122-123; Federal support, performance for the 37-41, 200; performance outside field of specialization, 118; fund allocations, by industry, 256; private support, 41, 122; public vs. private support, 41; rate of return, manufacturing industries, 199; recipient organization performance, 113, 115, 118, 122-123; return on investment, 34; sources for funds, 42, 202-203
